2 — Despite his travels and knowledge of the desert, the Emir has made a small mistake. The pernicon's diet does not consist mainly of other animals, as he appears to imply. They are primarily herbivores. Jesouhd Ye'esif is, though, accurate about the creatures' method of attacking. Creatures "eaten" aid the creature by providing much-needed liquids, and some nutrients, but pernicons cannot live on fluids alone.

3 — Note that the pernicon's attack form will not harm certain creatures greatly, if at all, at the DM's discretion. The "immune" group should include all undead, most

elementals and para-elementals (including such creatures as the thoqqua, dune stalkers, grues, etc.), some outer-planar creatures, golems, and so on. The DM should remember how the pernicon harms — it sucks out body liquids. If a creature has no body fluids, it won't be harmed, except by the pincer being clamped on or pulled off.

4 — This author considers 1-4 hp damage for the removal of a pincer of ½ inch in length (at most) to be excessive, and recommends only 1 hp damage be taken instead.

5 — A pernicon attached to a victim has AC 10. Note that if an attack is made on such a pernicon and the attack misses, a "to hit" roll against the victim should be required 50% of the time, with no dexterity adjustments applicable. Even if the pernicon is killed, its pincers remain in the victim, as noted in the FIEND FOLIO® Tome, p. 72.

6 — For dealing with combat between pernicons and armored characters, refer to the accompanying article.

7 — An inhabited "town" of pernicons will rarely, if ever, be located more than a mile from the border of the desert.

8 — Female pernicons lay eggs twice a year. Special moisture-holding chambers are made by the pernicons, by gluing grains of sand together with sticky saliva (produced from fluids drained from victims), to hold the hundred or so eggs deposited by each female after mating. Because of the thin, membranous shells of the eggs, they have to be deposited on moist sand lest they shrivel up and die before hatching. This is the reason that the pernicons tunnel down to reach ground water or moisture (which is closer to the surface near the border of the desert), and the major reason that they possess water-detecting antennae. After sand on the chambers' floor is sufficiently dampened and the eggs deposited, the chamber is sealed by saliva-glued sand to contain the moisture. The young hatch within a week or so and eat their own shells (and sometimes their neighbors' shells, or even their neighbors). They then burrow out to join the colony. As the average, only 1-6 of a pernicon's hundred laid eggs will survive to maturity.

9 — There is a 1% chance that an encounter with wandering pernicons will be with a moving colony, in which case the number appearing will be the lair size rather than the normal "wandering" size (i.e., 300-3000 rather than 4-40). Player characters meeting such a group are advised to get as far away as possible, as fast as possible. Pernicons en route to a new lair are particularly aggressive, since they will need animal fluids for the construction of the tunnels and egg chambers of the new lair (see note 6).

10 — The FIEND FOLIO Tome is vague as to what a "large quantity" of water is. This author recommends that any water body of 5,000 gallons or more should be easily detectable. Smaller amounts should be detectable at closer ranges.

11 — This could be compared to the

liquid-crystal display in digital watches. Electricity causes the liquid crystal molecules to align in such a way as to absorb light, becoming visible to the observer. The radiations of water cause the pernicon antenna's oily fluid to behave in the opposite manner — going from a neutral state to chaotic and agitated. Fire causes the reverse, the liquid going to a rigidly structured form. Submersion in water destroys the antenna; the oily substance disperses rapidly, bursting out of and shattering the antenna.

12 — If a pernicon antenna is used by a cleric or druid as an additional material

component for a *create water* spell, the spell will produce 10%-60% more water than it would otherwise. As with other material components, the pernicon antenna will disappear after the spell is cast.

13 — Successful removal is not automatic. The base chance, rolled on a d20, is equal to the dexterity of the character (or the average of two characters) attempting the removal, modified as follows:

If the first time ever tried, -10 (then -9 on the second, -8 on the third, etc.);

If special tools are used, + 2;

If thieves' tools are used by two characters, no adjustment;

If thieves' tools are used by one character, -2; and,

If other tools are used, such as hairpins, -2 (two characters) or -4 (one character).

The task requires the total concentration of the individual(s) involved. If work is disturbed before finishing the removal, there is an 80% chance of the antenna being ruined.

14 — Pernicon antennae should have saving throws for resisting damage from falling. Normally 20 is the proper save, but in such a bone case, it should be 10, adjusted upward by 2 for every 10' fallen. A metal case grants a base saving throw of 8.

The pernicon: a new version

by John Nephew

While the previous article may be applied to the official pernicon found in the FIEND FOLIO® Tome, hopefully making it easier to integrate into your campaign, several problems remain with the original monster. It is awkward for a DM to handle in combat, particularly if the monster appears in large numbers?; and its hit points, damage, and constitution drain are extremely great and powerful characteristics for a two-inch insect to have.

Herewith is presented the *revised* pernicon. Parts of the following description are taken directly from the FIEND FOLIO Tome (p. 72) and credit for these portions (and, of course, the original idea) goes to the original author of the pernicon, Mary Patterson.

PERNICON

FREQUENCY: *Rare*

NO. APPEARING: 4-40 (*in lair or moving colony, 300-3000*)

ARMOR CLASS: 3

MOVE: 12" (*plus jumping*)

HIT DICE: 1 *hit point*

% IN LAIR: 20% (*1% chance of the encounter being with a moving colony*)

TREASURE TYPE: *See below*

NO. OF ATTACKS: 1

DAMAGE/ATTACK: 1 *hit point*

SPECIAL ATTACKS: *Continuous damage*

SPECIAL DEFENSES: *Nil*

MAGIC RESISTANCE: *Standard*

INTELLIGENCE: *Semi-*

ALIGNMENT: *Neutral*

SIZE: *S (2 inches long)*

PSIONIC ABILITY: *Nil*

Attack/defense modes: *Nil/nil*

LEVEL/X.P. VALUE: *1/7 + 1/hp*

A brightly colored insect rather like a grasshopper about 2 inches long — red, yellow, ochre, and light blue — the pernicon inhabits the outer regions of deserts. It

is much prized by the nomads of these regions, because the antennae on its head are water-diviners, vibrating and giving off a low hum when within 120' of a large quantity of water.

The pernicon is usually inoffensive, but it attacks in large numbers if disturbed, accidentally or otherwise. It leaps on its victims and grips exposed flesh with the set of pincers at the rear of its abdomen. The pincers themselves do 1 hit point of damage and then begin draining the fluids of the victim at the rate of 1 hp per subsequent round, without requiring further "to hit" rolls. Normal pernicons are capable of draining 5 hp of fluids in that manner (thus being capable of doing 6 hp damage total), at which point they are quite bloated and will drop off the victim to crawl away.

A pernicon attached to a victim has an armor class of 10. However, on an attack against it that misses and is a roll of 4 or more under the number needed to hit it, the victim is hit and receives half-normal weapon damage (rounded down). If the insect is slain while attached, the pincers remain in the victim and continue to drain hit points (fluids) at the rate of 1 point per round. Removing the pincers, which can be done easily in 1 round by the victim or a companion, inflicts an additional 1 hp damage but stops the fluid loss.

Leader pernicons: In each colony of pernicons, there is one extraordinary leader pernicon, whose main functions are deciding when it's time to leave the lair, choosing where to establish a new lair, and breeding. Leader-type pernicons are different from normal sorts as follows: AC 2, 2 hp, 4" length, low intelligence, and the capability to drain up to 10 hp of fluids (at 1 hp/round). A leader-type pernicon invariably has its own chamber in the lair, and there is a 25% chance that the chamber's walls are of saliva-glued gold dust (value 2-12 gp if melted down). In mass combat (see below), the leader is treated as an individual mon-

ster, never as part of a swarm.

Combat: Since pernicons are small creatures that attack in large numbers, they are difficult to manage in a conventional combat manner. The following suggestions should help.

The main pernicon swarm always divides into small swarms of relatively equal size for each opponent. A swarm may then be in some ways treated as if it was a single creature (similar to the cifer; see the FIEND FOLIO Tome, page 19). Each pernicon has 1 hp, so the collective "creature" has as many hit points as there are pernicons within it. A victim is more likely to attack successfully against such a large number of insects, so the swarm's opponent receives +1 "to hit" for each ten pernicons alive and lighting him when the attack is made.

The number of pernicons that can actually attack depends on the clothing or armor of the opponent, as noted below.

Armor/clothing	Pernicons able to attack
Bare	200
Cloth	100
Leather	50
Studded leather	40
Ring mail	30
Scale mail	20
Chain mail	15
Splint mail	15
Banded mail	15
Elfin chain mail	12
Plate mail	10
Field plate	5
Full plate armor	3

Shields affect armor class (they can bat away insects), but not the number of creatures able to attack.

Combat is carried on in a fairly normal manner. When there are very large numbers of pernicons, it is recommended that the DM take a percentage (20 minus the number required to hit a pernicon, times

The ecology of the peryton

by Nigel Findley

"Hearts!" The younger mage brought his fist down on the table with enough force to make the tankards jump. "Explain that to me! Why hearts?"

I maintained my aloof manner. "Strange creatures have strange habits," I remarked casually. "And what could be more strange than a beast with the head and antlers of a deer and the body and wings of a vulture?"

The young wizard's elder companion sniffed. "An answer that is no answer. We came to speak to Nex — Nex the Collector, Nex of the Arrow — and find that the famous bounty hunter is no more than a child of twenty summers with a disrespectful tongue."

I narrowed my eyes and allowed a half-smile to creep onto my lips. "A *man* of only twenty summers I may be," I said quietly, flicking my glance between the two of them, "but in that time I have seen — and slain — more varieties of creature than you can name, even with all your wizards' learning."

"But," I continued less coldly, "this is beside the point. Perhaps all your questions will be answered by the carcass of a peryton, which I can and will deliver to you for . . ." I paused, making it seem as though I was just now deciding on a price, when actually I had made up my mind as soon as I saw the rich cloth of their robes and the lavish gold chains around their necks. " . . . ten thousand pieces of gold." I leaned back and awaited the storm of protest that was sure to follow.

And, as I had expected, the face of the younger wizard stiffened and became flushed. But, to my surprise, his elder companion only hesitated a moment, then nodded slowly. "The Wizards' Guild is prepared to meet your fee," he said. "Ten thousand gold nobles for a specimen of an adult peryton."

I tried, somewhat unsuccessfully, not to smirk. This kind of dickering I liked; that fee was two times my usual price. "The deal is struck," I said. "Now, of course, that does not include my expenses. . . ."

"You hunt the peryton?" I turned to find the source of the rough, low voice that came from behind me. The man who had spoken wore a deep purple tunic of fine workmanship. On a chain around his neck hung a silver token of a bird. Though almost three times my age, he was well-muscled and seemed to carry himself with confidence. I had brought my hand to my sword hilt as I turned, but let it drop again when I noticed that he was unarmed.

"Yes, good cleric," I said, "or so I intend. If such matters are your concern, join us. My name is—"

"Nex. I know. I am Amhotep." He pulled up a chair and seated himself at the table. "And what do you know about the peryton that you can think of hunting it without showing any doubt or concern?"

I shrugged. "I know that the beast dwells in mountainous regions, such as the peaks two days' ride north of here."

"That hardly seems sufficient."

My voice hardened and I gestured toward my long bow, wrapped carefully in velvet and propped up in the nearby corner. "I also know that no creature lives. that I have seen over an arrow," I replied. "What more do I need to know?"

"Much more." The cleric's voice grew grim and cold. "Much. Knowledge is power, and ignorance can be death. Especially so if you intend to hunt the peryton with simple clothyard arrows. The arrows or any other weapons you may use — must be ensorcelled, and the magic must be strong, or they will simply glance off the creature's body."

I leaned forward and opened my mouth to comment, but he raised a hand to cut me off and kept talking. "Be still. There is yet more you should know. The peryton faces no such difficulty in slaying *its* foes. The creature's horns are hideously sharp and strong — some say they are magical, but I know better. They inflict terrible wounds, and the peryton wields them with skill worthy of a champion."

"You speak as someone intimately familiar with the beast," I put in.

If the cleric noticed the sarcasm contained in that remark, he gave no sign. "Familiarity comes through experience. When I was younger, I, too, hunted the peryton."

The two mages, who had been listening quietly to the cleric until this point, now turned to one another, exchanged glances, and murmured. I felt their attention being drawn away from me and toward the purple-clad cleric.

"Please continue," said the elder mage, and the cleric complied.

"My three brothers and I journeyed to those peaks you speak of," he said, turning slightly toward me with those words. "We also intended to return with a peryton as a trophy." He laughed mirthlessly. "My brothers — or, to be more exact, their bones — are still there, on those mountain slopes.

"For three days we searched diligently for signs of the creature, without success of any sort. But on the fourth day, the perytons — three of them — found us. We were traversing a treacherous rock face when their shadows passed over us, just as we heard the sound of their beating wings for the first time. Their shadows were as those of *men*, not beasts — a fact which we all observed, and which distracted us for a single fatal instant.

"By the time that instant had passed and we turned to fade them, the perytons were swooping down upon us from out of the sun." The cleric inhaled deeply, let the breath out slowly, and closed his eyes briefly as if in pain. "Two of my brothers died in that first pass, disemboweled by those flashing horns that ripped through leather as a sword through linen. By luck — or by the will of Thoth — my eldest brother and I evaded that first swooping attack. We began to descend the slope quickly, seeking cover, as the two beasts that killed them came out of the sky and landed near the bodies of our brothers.

"Though on the ground it may appear clumsy — almost comical — when airborne the peryton is a wonder to behold and a thing to fear. We were transfixed by horror at the sight of that third dark shape climbing, turning abruptly, making ready for another dive . . ." The cleric shuddered, and for a moment resumed the detached tone he had used earlier in his lecture.

"The creature maneuvers well; in a stretch of only about two hundred paces, it can turn a full ninety degrees while flying at full speed — and it can reach full speed in a mere minute after launching itself into the air. I have seen few creatures larger than a hawk that can equal it." During this interlude, the cleric's eyes were focused on me; now he turned his attention back to the two wizards and resumed the story.

"Running and scrambling, casting occasional glances backward and up at the sky, my brother and I were able to traverse less than one hundred yards down the slope before the third peryton went into another dive, with my brother as its target. And this time he was not so fortunate; though the slashing horns missed him, the peryton's body did not. The creature rammed into his upper body — whether by design or chance I could not tell. He was swept from the small plateau on which he had hoped to stand and fight, and he landed on a tiny ledge some thirty feet below.

"It would have been a blessing if the impact had killed him. As it was, my brother survived the fall, but both legs, and I believe his back, were broken. Unable to move or defend himself, he could still call to me for help that I was unable to give. And

he could scream — oh, how he screamed — as the peryton settled on the ledge beside him.

"I escaped with my life, for the simple and dreadful reason that three perytons, and not four or more, swooped down on us that day. And of all the visions that haunt me of that terrible day, the worst was the sight of that vicious third beast tearing my brother's heart from his still-living body."

The cleric lowered his head, brought one hand up to touch the bird-token around his neck, and seemed to be mouthing a silent prayer. The rest of us were silent as well. As much as part of me wanted to do so, I could not bring myself to utter a sarcastic comment, to try to get the wizards again thinking about me and the reason we had come together at this table in the first place.

Then the cleric raised his head and gazed vacantly out at the mages seated across from him. The younger one shifted uneasily, then ventured to speak. "Perhaps, then, you can enlighten us where others cannot. Why do these creatures require the hearts of their victims?"

"The answer to your question is brief," the cleric said. "For reproduction — that much any sage can tell you. But to understand that answer, first you must know some things about the background of the peryton."

By this time I had regained my normal demeanor, looking and acting bored and, I hoped, convincing the others at the table that I actually felt that way. "Explain, then, if you must, and stop leading us along like this," I told the cleric.

He continued in a tone as if I had never spoken. "The origin of the peryton is lost in the backwaters of time," he said. "Many of the wise say that the creature is the result of magical experimentation — but that is not so, though I do not say that there is no magic in the peryton. Rather, the beast is more akin to beings like the githyanki and the mind flayer, in that none of them are native to this world or the plane it resides upon."

The younger mage raised his eyebrows and exhaled a short puff of disbelief, but the cleric was oblivious to this reaction. "The peryton was the dominant race on its home world," he continued. "Though they are all naturally independent and harshly competitive, at one point in their history the creatures banded together to subjugate — or destroy — all that dwelt around them. Such an alliance among chaotic creatures like these could hardly endure, but it did persist long enough to win a world and send advance invasion parties — at least two, probably many more — to establish their outposts . . . elsewhere.

"It is said in the councils of the wise that the first such outpost was established on a great island nation called Atlantis, in a world similar to this one. Exactly what became of that nation I do not know. Perhaps the resistance to the perytons' attempted conquest was too great, or perhaps the perytons overstepped themselves. What-

ever the case, the entire island sank beneath the sea in a great upheaval. Though many others believe that this ended the threat of the perytons on that world, I have reason to doubt that stance. There still exists a prophecy that the perytons will bring about the eventual fall of one of that world's greatest cities, named Roma."

"Fascinating," interjected the elder wizard, but then his face took on a doubtful frown. "Yet, how could such a creature as the peryton travel the planes?"

"Through the powers of the mind," replied the cleric immediately. "By using the Talent, or what you might know as psionics. On their home plane, the perytons were possessed of the Talent, and it was through the Talent that the raiding parties intended to enslave this world and others."

"But —" The mage tried to break in, but Amhotep had anticipated his comment.

"Whether the perytons here lost their Talent gradually, over generations, or all at once, I know not, though I would suppose the latter to be true. This world is different from their own in so many ways. . . . The perytons that dwell in the mountain peaks of our world have lost their Talent, but they still possess their fierce, vicious nature and their scheming intelligence."

"What?" I blurted out, unable to control my surprise.

The cleric regarded me with a grim smile. "Oh, yes, my young hunter. They are as intelligent as most men, more so than many. They speak their own language, quite unlike that of any other creature. It is this intelligence, almost always unsuspected by those who would defeat them, that helps to make the peryton such a lethal adversary."

"All very interesting, good sir," said the elder mage, and he seemed to mean it. "But . . . the hearts?"

"That will soon become apparent," said the cleric, then resumed his narrative. "On its own world, the peryton eats nothing but the flesh of its prey. On this world — and, I suppose, others — the peryton is forced to broaden its diet to obtain the balance of elements its body needs. In addition to the flesh of creatures native to this world, it must eat plants and even some inanimate matter such as clay and soft ores.

"How these compounds are utilized by the peryton is, at the very least, interesting. In the same way that certain plants, on this plane and others, concentrate minerals from the soil in their stalks, the peryton assimilates iron and even heavier metals into its system, using these substances to strengthen and toughen its horns. The peryton's attack is not as deadly as it is merely because it is accurate, although the beast does indeed dive with terrible precision. The metals and minerals that the peryton consumes help to make its horns as hard as steel, able to take and hold a dagger-sharp point, unlike the antlers of normal creatures such as deer and elk, which are tapered but still rounded at the tips. A single slash, or a series of punctures, from those horns is enough to pene-

trate or push aside even metal armor, mortally wounding the flesh beneath it. It has been speculated that these metals also help to toughen the peryton's skin and feathers, which is why it cannot be wounded without enchanted weapons; however, I believe otherwise, since the peryton's coat of feathers is soft and downy to the touch. Quite possibly, its immunity to non-magical weapons comes simply from the fact that it is not a creature of this world."

Amhotep paused for two heartbeats, smiled, and nodded in the direction of the two mages. "And now to the hearts. The reason it craves hearts is, in essence, the same reason that it has such a varied diet: for mineral balance. The female peryton needs especially large amounts of the elements iron, potassium, sodium, and nitrogen to produce the metal-like shell of her eggs — if you find one, I dare you to break it open without the use of an acid, such as the one found in the albumen of the egg itself. As it so happens, the tissue of the human heart contains an abundance of these vital substances. Certainly there are other available sources, but none of the others so appropriately matches the peryton's ethos."

"Thank you for that, kind sir," said the elder mage. "We have been more than curious about that aspect of the beast, for reasons I daresay need not be explained to yourself. But a question remains, one you have raised yourself — the shadow."

The cleric smiled; it seemed to please him that the wizard had paid enough attention to remember that remark, and yet he began his response with a compliment that pleased the mage equally. "I would have been surprised had you not pursued that point. What I said, I meant quite literally: When the shadows of the perytons passed over me and my brothers, the shadows were those of men."

"When the sun strikes the body of a peryton, feet replace claws and arms appear instead of wings; the horns cannot be seen in the shadow, and the head rounds out to become that of a human — truly a sight that would be at least disconcerting, if it were not already so terrifying. And the shadow remains that way until the peryton has slain its chosen prey, whereupon the shadow it casts is that of its own body, and it then stays in that state until the creature has devoured and digested its prey."

"Whether this is some trick in the mind of the observer, or evidence of a higher power at work, I know not. Perhaps it is an unconscious remnant of their Talent, some power that projects through the creature's shadow the image of the prey it seeks the most — humans. Then, when the beast has killed a human, this instinctive need is fulfilled and, for a time, the peryton ceases to project the human shape. I cannot say which of these ideas is accurate; what I do know is that I myself have seen the change from man-shadow to beast-shadow, as it

took place upon the vile creature that slew my last surviving brother."

"Truly fascinating," said the elder mage. "You have our sympathy," he added, gesturing toward his companion, "and our respect. But, as you must have already guessed, another question remains. Whence comes all of this detailed information that seems beyond the ken of even the most learned of sages?"

The cleric touched, then caressed, the silver bird pendant he wore. "I am honored by a source of knowledge that is denied, by its very nature, to most of the sages of this land."

The lecture and the questions now seemed to be at an end, and I had to admit to myself that I had been as engrossed as the wizards were in the cleric's story of him and his brothers, and the other things he had to say about the peryton. But, in saying all of it, he had clearly stolen all of their attention — and perhaps their gold as well — from me. I decided it was time to act decisively, and I did exactly that.

"Here," I proclaimed loudly, "is *another* source of knowledge denied to most sages." I reached beneath the table and grabbed my sack, talking while I extracted its contents. "You are the first to see one of my more recent trophies; in fact, I just finished preparing it earlier today. Notice the fine, membranous finish to the wings, and the lifelike position of the arms and hands. A good job, wouldn't you say?"

All three of them stared at the tiny stuffed body I had placed on the table. The cleric was the first to speak.

"A sprite?" he asked, quietly. "But why? These creatures are the most peaceable —"

"And beautiful," I cut in. "Notice the color of the clothing, and the way I preserved the texture of the pale skin."

The cleric slowly rose to a standing position; his face took on an expression I could not read. "Perhaps you *are* the one best suited to hunt the peryton," he said.

Then, suddenly, before I could react, he reached out and rapped me hard in the center of my chest with his forefinger. "You have nothing in here that the peryton could desire."

ECOLOGY OF THE Phantom Fungus

Terror from Beyond the Stars

By Scott Gable

Art by Michael Jaecks

“The rural tales are queer. They might be even queerer if city men and college chemists could be interested enough to analyze the water from that disused well, or the grey dust that no wind seems to disperse. Botanists, too, ought to study the stunted flora on the borders of that spot... People say the colour of the neighboring herbage is not quite right in the spring, and that wild things leave queer prints in the light winter snow.”

— H.P. Lovecraft, *The Colour Out of Space*

From the field notes of Sir Randolph Corday, mycologist to the King (recovered from his staging camp in the lower Hazelwood):

Most adventurers know fungus only as the tiny toadstools that litter the forest floor. Sure, eating the wrong one could be disastrous, but otherwise, these strange growths pose no threat except to corpses—those that are prepared to return to the dirt. Mushrooms are harmless, right?

What if I were to tell you that many of those mushrooms you saw in the forest were actually the same creature? Or, that those mushrooms are really only the “flowers” of the creature and the rest of it lies hidden, just underground? Or, that this buried creature might span 3,000 acres with a total mass greater than any dragon? That, my friends, is exactly what a fungus is.

Fungus is primarily composed of chitinous threads called hyphae that branch and crisscross in a vast network throughout the soil. These hyphae are ever growing and seeking new food sources, which are promptly broken down into the basest components and absorbed by the fungus. In this way, fungus decomposes organic matter and performs a vital cycling of matter. While fungus proves both strange and fascinating, and perhaps a touch humbling, it is not typically a threat to the living.

However, I have found incontrovertible proof of an even stranger fungus. This fungus exhibits the strangest of behaviors and physiology. It acts with deliberation and intent. I believe this fungus can only be from beyond the realms that we know.

Physiology of the Phantom Fungus

"...when he see all the trees a-bendin' at the maouth o' the glen... an' smelt the same awful smell... they was a swishin' lappin' saound, more nor what the bendin' trees an' bushes could make, an' all on a suddent the trees along the rud begun ter git pushed one side, an' they was a awful stompin' an' splashin' in the mud. But mind ye... he didn't see nothin' at all, only just the bendin' trees an' underbrush."

— H.P. Lovecraft, *The Dunwich Horror*

My initial claims, at least, are clearly supported by various heroes' tales of confrontations with a "phantom fungus." Imagine, an invisible mushroom! It was this phantom fungus that I sought to study when I set out for the dark Crinderfeld domains.

The handful of stories that mention this strange creature are isolated to but a few regions. Seeking out the locals in the outer Crinderfeld Marches, I had hoped to discover clear evidence. Eventually, I found a few gnomes who had encountered and slain such a beast. They recounted the experience of being attacked by a foe they could not see, never knowing what was gnashing at their faces and defeating the beast only through luck.

The creature's dead body, they said, became visible a short time later. Unprompted, they described it as a giant, grotesque mushroom with a gnarled, ropey texture. The stalk, however, divided into four equivalent stumps that served as a means of locomotion. The top of the "mushroom cap" opened in a gaping maw of four-fold, radial symmetry lined with what appeared as chitinous teeth. Ropey knots, consistent with a rudimentary sensory organ, clustered around this mouth and around the rim of the cap. Unfortunately, the remains dissolved after several minutes and left nothing behind. Several other accounts indicate that this fungus may have several types.

The locals of these secluded areas have developed a "leave well-enough

alone" attitude and avoid the phantom-filled forests. They have found that if they leave the creatures alone, the creatures typically leave them alone. However, according to local legends, much larger specimens have destroyed entire villages. Clearly, more investigation is needed.

The Phantom Fungus and the Fungal Collective

The phantom fungus is but a single stage in a strange and complex life cycle. Is it an individual creature or a part of a larger superorganism? Where does the individual begin?

The phantom fungus is a part of a communal organism more properly called a fungal collective.

Violet Fungus & Shrieker

As seen among mundane fungi, the mushroom found on the forest floor is merely the fruiting body of the fungus and is the result of the fungus's sexual reproduction; sexual reproduction in fungi does not require multiple individuals. This temporary "flower" creates and distributes the spores that perpetuate the species. Whether carried on the wind or on passing creatures, the violet fungus spores will develop into a new fungal node (see below) if they survive.

The violet fungus remains attached to the fungal collective by its hyphae. However, as a free action, the violet fungus can detach itself from the greater organism to move about on these durable appendages; as a move action, the violet fungus can reattach itself by burrowing its hyphae into the ground wherever the fungal collective is established. As long as it remains attached, the entire fungal collective senses what the violet fungus senses. The violet fungus blindly attacks anything that approaches it when disconnected, but while connected, it shares the intelligence of the fungal collective and may delay an attack out of guile.

The shrieker is a separate species of fungus that occasionally forms a symbiotic relationship with violet fungi and the associated fungal collective.

Phantom Fungus & Variants

"Whatever the horror was, it could scale a sheer stony cliff of almost complete verticality...."

...It's invisible... It's a frightful thing to have alive, but it isn't as bad as what Wilbur would have let in if he'd lived longer. You'll never know what the world escaped. Now we've only this one thing to fight..."

— H.P. Lovecraft, *The Dunwich Horror*

The phantom fungus is a false fruiting body. Though it roughly resembles a mushroom and arises in a similar way, it does not bear spores and is the result of the fungal collective's asexual reproduction. These structures all begin the same, showing differentiation only at the end of their development; the entire growth cycle can take as little as 12 hours. The phantom fungus is a common result, but other variations are also possible. The phantom fungus serves as sentry and scout. Other variations have their own niches; all specialize in service to the fungal collective.

Though a phantom fungus and its variants typically detach themselves from the fungal collective as soon as they can, they can re-establish the connection as a move action by extending their hyphae into the ground wherever the fungal collective is established. They must remain stationary when connected to the fungal collective, but as a free action, they can disengage and move normally.

A phantom fungus and its variants cannot reproduce. They arise only through the fungal collective, established by a fungal node. Once active, the phantom fungus continues to grow. The common phantom fungus is but a first stage: a mature fungal horror is truly terrifying to behold.

The fungal collective dictates the behavior of all phantom fungi and variants. When detached from the fungal collective, they are treated as "knowing tricks or having a purpose" as detailed under the Handle Animal skill. Treat the fungal collective or fungal node as the trainer; given the intimate nature

of all communication within a fungal collective, Handle Animal checks are automatically successful.

Typically, a phantom fungus stands vigilant and unmoving as a sentry, using its natural invisibility to good effect. When trouble arises, it acts quickly to defend the fungal collective. While connected to the fungal collective, it can respond to a threat in another area. Once it detaches itself, it loses that awareness until it sees the threat directly or reattaches itself to the fungal collective.

Phantom fungi may serve as scouts, but due to their limited intelligence when disconnected from the fungal collective, they can offer only their direct sensory impressions back to the collective. They return to the fungal collective when a mission is completed.

One last role of phantom fungi is to collect organic matter. When times are lean or more resources are required, phantom fungi scour the land for any organic matter, either living or dead. They carry this back to the fungal collective in their gaping maws, to be slowly absorbed.

Fungal Node

"The colour... was almost impossible to describe; and it was only by analogy that they called it colour at all..."

When they looked back toward the valley... the farm was shining with the hideous unknown blend of colour; trees, buildings, and even such grass and herb-age as had not been wholly changed to lethal grey brittleness. The boughs were all straining skyward, tipped with tongues of foul flame... over all the rest reigned that riot of luminous amorphousness, that alien and undimensioned rainbow of cryptic poison... seething, feeling, lapping, reaching, scintillating, straining, and malignly bubbling in its cosmic and unrecognizable chromaticism."

— H.P. Lovecraft, *The Colour Out of Space*

A fungal node holds a fungal collective together. In a sense, it is the "brains" of the operation, but the intelligence of the fungal collective really comes from

the whole of each of its constituent parts. Clearly though, it is essential for managing and coordinating all activities performed by the fungal collective. Each fungal node differs slightly in personality and extends this personality into the collective intelligence. These give the collective a type of hive-mind.

The fungal node itself simply appears as a giant truffle, and it lies fully underground—typically just a foot or two below the surface. Its hyphae extend from it underground in every direction, forming a sort of a massive chitinous web. These hyphae may stretch for miles and, together, they form the mycelium of the fungal node. This connects it to each and every constituent member of the fungal collective. The mycelium is so extensive that any member of the fungal collective can extend hyphae into the ground, while within the fungal collective's range, and establish a connection with the mycelium just below the surface of the ground.

The mycelium stretches in all directions to a range determined by the age of the fungal node and the availability of resources. The mycelium can extend through any organic matter; it cannot penetrate inorganic matter in the same way, but it can take advantage of minute cracks and, like tree roots, eventually break through most natural barriers. By secreting enzymes into the soil, the mycelium speeds up decomposition and absorbs the decomposed organic material as nutrients.

The mycelium extends throughout all available organic matter, including the local flora. This presents an opportunity to attack the affected plants, but the fungal collective instead uses it to exert control over the plants.

If the ranges of multiple fungal nodes overlap, they develop connections between their mycelia. The results are unpredictable. Often, the fungal collectives work collaboratively and toward the common interest. However, when there is a sizable difference in age among the fungal nodes, one fungal collective dominates and, ultimately, takes complete control. On rare occa-

sions, open hostility erupts between two fungal collectives.

Occasionally, five or more fungal nodes—all a part of the same fungal collective—divert all energy to one of their number and evolve into a grand fungal node. This highly intelligent creature appears to be the apex of fungal evolution. It grows from the fungal node upward and breaks the surface of the soil as a giant mushroom, with a distinct personality. These grand fungal nodes show great variety in appearance from one to another, but each correlates with strange, otherworldly colors. Telepathy allows for greater communication within and without the fungal collective, and they can shift their consciousness into an iridescent cloud of spores and move about. The increase of power with this new stage of life is dramatic, both in its potent abilities and the range of its control.

Occasionally, a grand fungal node must relocate. This is not a simple procedure and requires a tremendous amount of energy. For an entire year, the fungal node directs the fungal collective to focus on collecting organic matter: the fungal collective denudes their entire range of organic matter.

This is the grand sporulation and all plant and animal life—including humanoids—is at risk, as the grand fungal nodes considers all organic matter fuel for the process. With sufficient fuel, the grand fungal node, impervious within a capsule of strange organic material, launches into the sky in a supernatural display of pyrotechnics.

Within this capsule, it can relocate and start anew in any land far or near: some claim the capsules are even capable of interstellar and interplanar travel. The land left behind is drained of life and remains a barren wasteland of gray and brittle ash, devoid of all organic material. In every case, however, a single fungal node is left to attempt a fresh start.

Outer Ones (Mi-Go)

"They were pinkish things about five feet long; with crustaceous bodies bearing vast pairs of... membranous wings and sev-

eral sets of articulated limbs, and with a sort of convoluted ellipsoid, covered with multitudes of very short antennae, where a head would ordinarily be....

— H.P. Lovecraft, *The Whisperer in Darkness*

Within the larger and more advanced fungal collectives, special caretakers are often on hand. In a special process, the false fruiting body mentioned previously avoids differentiation into a phantom fungus or variation and begins incorporating both plant and animal characteristics. Requiring a full week of development, the result is a creature known simply as an outer one.

In addition to the grand fungal nodes, outer ones are among the only fungi of the fungal collective capable of communicating intelligently with the outside world using their limited telepathy and abhorrent buzzing approximation of speech. This makes them ideal for the role of ambassador to other sentient races. They are also the only ones (aside from the capsule of the grand fungal node) capable of surviving the void of interstellar travel, and they have been known to pass along the mind-shattering secrets of

things beyond that they have collected to those deemed worthy.

Origins

"The main body of the beings inhabits strangely organized abysses wholly beyond the utmost reach of any human imagination. The space-time globule which we recognize as the totality of all cosmic entity is only an atom in the genuine infinity which is theirs."

— H.P. Lovecraft, *The Whisperer in Darkness*

Whoever reads this likely thinks me mad already, but I must go on. I have spoken to them; or rather, they have spoken to me. They are not creatures of the natural order that philosophers study. Yes, they have been here for eons and have integrated well with our natural world, but they originate from far away. Just by looking at some of them, you can tell they are not wholly within our world but rather they float between two worlds.

More than that, I believe they actually draw some sustenance from other planes. If my theories are correct, their hyphae are rooted not entirely within our reality but extend into the very fab-

ric of the multiverse and draw energy from the planes. This might begin to explain their supernatural abilities and amazing diversity. What if all of the fungal collectives throughout the multiverse are connected? Perhaps there is really only *one* fungal collective—massive and spanning ever greater realms.

I must go. They promise to show me even more.

Differentiation

The fungal collective is a rich and complicated array of creatures. Some are detailed here, others are hinted at, and still others are left to be discovered. All its elements are able to join the fungal collective.

Variations (on the phantom fungus)

The phantom fungus is simply one of many variations of mobile fungus that arise from a fungal collective. The phantom fungus is reprinted here for reference. In each case, the variants are identical except for what appears under their individual entries; note that the invisibility power of the phantom fungus is not shared by the variants.

Space 15 ft.; **Reach** 5 ft. (20 ft. with tentacles)

Special Attacks constrict, consume, improved grab, trample

TACTICS

Before Combat A fungal horror makes no preparations before combat. They simply charge fearlessly into battle at the first sign of prey.

During Combat Fungal horrors trample as many foes as possible, then lash out with their four massive tentacles.

Morale Fungal horrors fight to the death unless they are in the middle of a mission.

STATISTICS

Str 29, **Dex** 10, **Con** 23, **Int** 2, **Wis** 11, **Cha** 10

Base Atk +13; **Grp** +30

Feats Alertness, Cleave, Combat Reflexes, Improved Initiative, Improved Natural Attack (tentacle), Power Attack, Run

Skills Climb +17, Listen +12, Move Silently +5, Spot +12
SQ frightful presence, greater invisibility, walk anywhere

SPECIAL ABILITIES

All-Around Vision (Ex) A fungal horror has eyes scattered all about its body, allowing it to see everywhere at once and giving it a +4 racial bonus on Spot and Search checks and immunity to being flanked.

Constrict (Ex) A fungal horror deals automatic tentacle damage with a grapple check.

Consume (Ex) A fungal horror can consume a grabbed opponent with a successful grapple check. The fungal horror drags the grappled opponent within reach of its hyphae and begins to consume the opponent's essence, dealing automatic hyphae damage. In any round that a fungal horror succeeds with its consume ability, colorful wisps of the prey's essence flow through this creature's body and make it visible until the beginning of its next round.

Frightful Presence (Ex) The appearance of a fungal horror is greatly unsettling. Whenever a fungal horror becomes visible—such as by its use of the consume ability or with *see invisibility*—its presence takes a toll. Creatures within a 30-foot radius are affected if they have fewer HD than the fungal horror. A successful Will save (DC 19) negates the effect and grants immunity to this effect for 24 hours. A failed Will save results in the target being panicked for 4d6 rounds if it has 4HD or less and shaken for 4d6 rounds with 5 HD or more. This is a fear effect.

Greater Invisibility (Su) A fungal horror is constantly under the effect of *greater invisibility* (CL 20th). This effect is not susceptible to *invisibility purge* but is susceptible to *see invisible*. They become visible one minute after death. (Invisible creatures receive a +2 bonus on attacks against sighted opponents, ignore Dex bonuses to AC, and gain concealment. The attack modifier above already reflects this.)

Improved Grab (Ex) If a fungal horror hits a smaller creature with a tentacle, it can start a grapple as a free action without provoking attacks of opportunity.

See Invisible (Su) A fungal horror is treated as if always under the effects of *see invisibility*.

Skills (Ex) A fungal horror gains a +8 racial bonus Climb checks and can always take 10 on Climb checks.

Trample (Ex) As a full-round action, a fungal horror can trample smaller opponents (Reflex save for half; DC 28). A fungal horror engaged in a grapple can trample at half speed with a successful grapple check and may include the grappled foe as a trample target. Instead of slam damage, any creature trampled by a fungal horror takes automatic hyphae damage.

Walk Anywhere (Ex) A fungal horror never suffers penalties to movement while on a natural surface—including soil, wood, or stone. Rough terrain is disregarded. Walls and ceilings are no obstacle, and a fungal horror moves across them as if walking on the floor: speed is never reduced, climb checks are not necessary, and its tentacles are always free.

Languages Common, Undercommon

SQ shifting consciousness, telepathy 500 ft., territory

SPECIAL ABILITIES

Blindsight (Ex) A grand fungal node can sense vibrations within its territory using its extensive array of hyphae.

Hyphal Array (Ex) A grand fungal node has an immense network of hyphae burrowing through all organic matter in its territory. Within 250 ft. of the main body, the grand fungal node can manipulate the trees, vines, and roots as tendrils to attack foes. It may attack a single target or multiple targets anywhere within its range. Making one attack is a standard action and all 4 is a full-round action. Attacks of opportunity within this range are triggered normally.

When a creature begins its turn grappled by one of the grand fungal node's tendrils, hyphae exert their influence to feed on or usurp the victim. Each round as a part of its grapple, by feeding on grappled prey, the grand fungal node deals 1 point of Con drain and heals 20 hp. Alternately, the grand fungal node may usurp its prey: the victim must make a Will save (DC 31) or be controlled as per *dominate monster*. This Supernatural ability is Charisma based. Creatures can regain control with a *remove curse* or gain a new saving throw with *remove disease* or similar magic.

Additionally, the grand fungal node may raise corpses as temporary zombies using the usurp ability. This functions as *animate dead* (20th CL).

Improved Grab (Ex) If a grand fungal node hits a smaller creature with a tendrils, it can start a grapple as a free action without provoking attacks of opportunity.

Otherworldly Aspect (Ex) A grand fungal node has a pulsing, throbbing chitinous body with alternating whorls and pits and with coruscating patterns of color. This grants the grand fungal node the benefits of *displacement*.

Shifting Consciousness (Ex) Due to its enormous network of hyphae, a grand fungal node can shift its consciousness to other fungal nodes (free action) or to spore clouds (see below). As it shifts consciousness within its territory, its abilities transfer to each new center of consciousness. For instance, a grand fungal node normally has complete control over the organic matter within 250 ft. of the main body using its hyphal array ability; however, if it creates a spore cloud, the ability becomes centered on the spore cloud.

Spore Cloud (Ex) A grand fungal node's secondary form is spore cloud, a scintillating cloud ejected from the main body and containing thousands of miniscule spores. This distributes the grand fungal node's consciousness into the cloud; the main body retains just enough awareness that, if it is attacked, full consciousness is restored to the main body as an immediate action no matter where the spore cloud is located, dispersing the spore cloud. The spore cloud maintains telepathic contact with the hyphal array and the collective. The spore differs from the main body are:

Grp –

SPECIAL ABILITIES

Energy Drain (Su) Living creatures damaged by a spore cloud gain 1 negative level. For each negative level received, the spore cloud gains 5 temporary hit points. After 24 hours, creatures with negative levels must make a Fort save (DC 31) for each negative level or permanently lose that level. This ability is Charisma based.

Damage inflicted on a spore cloud does not transfer to the main body. If a spore cloud is reduced to 0 hp, it disperses, and the grand fungal node's full consciousness immediately transfers back to the main body. Only one spore cloud can exist at a time. A new one can be created as a standard action.

Territory (Ex) Each grand fungal node controls a territory. This territory will consist of a minimum of 1,000 ft. of dense, lush vegetation. Beyond this central 1,000 ft., the territory is more sparsely populated (for example, thinning woods and grasslands) or the densely packed vegetation may continue. The grand fungal node maintains its network of hyphae throughout the entire territory (up to several miles in diameter). The territory represents the grand fungal node's realm of direct influence. Spore clouds must remain within the territory.

Outer Ones (Mi-Go)

"They... traverse the heatless and airless interstellar void in full corporeal form, and some of its variants cannot do this without mechanical aid or curious surgical transpositions. Only a few species have the ether-resisting wings... Those

inhabiting certain remote peaks in the Old World were brought in other ways. Their external resemblance to animal life, and to the sort of structure we understand as material, is a matter of parallel evolution rather than of close kinship. Their brain-capacity exceeds that of any other surviving life-form, although the winged types of our hill country are by no means the most highly developed. Telepathy is their usual means of discourse...."

— H.P. Lovecraft,
The Whisperer in Darkness

These winged wonders have a soft, chitinous body with many legs. At the end of each leg is a pair of saw-toothed claws capable of the same fine manipulation that fingers allow. Where their heads would be one sees only stubby, wiggling antennae. Unlike most members of the fungal collective, outer ones are self-replicating. Like others, however, specimens dissolve several minutes after death.

In addition to their innate abilities, outer ones are adept at using tools. While they can use the tools and devices of other races, they are excellent crafters and develop much new technology on their own.

Adventure Hook: the North Fields of Chilton

Those that farm the north fields of Chilton have long been known for their flights of fancy and their moonshine. The recent mangling of a young farmer, however, has brought serious attention from local authorities. The tale is spreading of the boy's arm disappearing almost to the shoulder into the very air—a clear cut through bone, blood everywhere. The lad swears that the air itself attacked him and on multiple occasions tried to block his long, frantic passage back to the farmhouse.

Many farmsteads have already been abandoned in the past year due to the phantom-filled woods beyond. The nights are filled with strange lights and stranger chitterings. What was only yesterday dismissed as wild imagination is today considered with deadly seriousness.

The ecology of . . .

The PIERCER

by Chris Elliott and Richard Edwards

Being the text of an address given to the Wizards Guild of Kabring by the Wizard Pyrex, shortly before his unfortunate demise. . . .

"Brothers and sisters in the arcane arts:

"There can be few here tonight who at some time in the course of an expedition underground have not had to leap out of the way of a piercer launching itself from its roost high in the shadows above. If the piercer misses, it is usually smeared across the cavern floor. If it hits, it often does so with deadly accuracy. Because of these aspects of its existence, few people have any real idea of the creature's true nature or life cycle. For instance, in the Bestiary of Xygag, the sage has this to say about the piercer:

"'Ye Piercer doth look like unto a stalactyte, and hangeth from the roofs of caves and caverns. Unto the height of a man, and thicker than a man's thigh do they grow, and in groups do they hang. If a creature doth pass beneath them, they will by its heat and noise perceive it, and fall upon it to kill and devour it, though in any other way they move but exceeding slow.'"

"Hardly pushing back the frontiers of scholarly analysis, I think you would agree. Unanswered therein are such questions as: How does it move? How does it feed? How, if it attacks only by sensing noise and heat, can it be so deadly accurate? And how, once it has

impaled its prey, does it regain its lofty perch?

"Well, we now have the answers. After much careful and often dangerous research and observation, I have established the life cycle of this remarkable animal, which I shall now relate while a number of my assistants illustrate with conjured images.

"The piercer is a mollusk, hatched from an egg the size of a hen's, laid in clutches of six or eight in crevices on cavern walls or floors.

"When first hatched, it resembles a slug with a rather more pointed tail than usual, but soon its abrasive tongue is scouring from the walls not only the fungi on which the young feed, but grit and sand. Gradually the grit and sand are secreted into a rocky shell around its body, growing from a thin, sturdy point to a cone as thick around as a man's thigh, as it grows. When the piercer is about a foot long, it develops the distinctive adult oculars or eye stalks, which can be extended from the shell to point back along it.

"After slowly making its way to the roof of a cave, the adult piercer hangs there by its sucker foot, oculars alertly canted, waiting for its prey. Great patience is required, but when a creature passes immediately underneath it, down it

plummets with fearful accuracy. Normally, its rocky shell will penetrate most hides, and it makes a kill.

"What *then*? I hear you ask. How do it feed on its prey, and how does it surmount the more immediate problem being stuck bolt upright in a skewer orc? Fair questions, indeed.

"What in fact happens is that the piercer must briefly leave its protective covering, and eat its prey while clear the shell. Now is when it is at its most vulnerable — save for when it mates. Whenever possible it prefers to partially extrude itself from its victim, overbalance, and then pull its shell clear. This done, it can feast at leisure on the corpse, before crawling back to the roof to begin again the long wait.

"From time to time, two piercers will make their way to the cavern floor, where they perform a slow and intricate courtship, tracing labyrinthine trails in the dust. At the end of this ritual, they emerge briefly from their shells to consummate their union, and then laboriously return to their rocky roosts. In due course another clutch of eggs is laid, and a other generation of these remarkable gastropods emerges to continue the cycle.

"Fellow thaumaturges, I give you *the piercer!*"

At this point a rabbit was released, and was promptly impaled by a small piercer previously unnoticed in the roof. Amid general uproar, the piercer was revealed to be an illusion, which was small consolation to the rabbit, but was generally agreed to be a stylish and highly professional finish to a fascinating address.

THE ECOLOGY OF THE PSEUDODRAGON

The Sting

"Fool me once,
shame on you.

Fool me twice ..."

"Well," said Buntleby, "I guess this meeting of the, what?—

Anti-Monster Hunters Association? Monster Savers Association? whatever—is hereby called to order. I wish

I had thought to bring my gavel."

"You mean Dreelix's gavel," pointed out Spontayne.

"Yes, of course."

"We'll just have to try and do our best without it," said Willowquisp, slapping at a mosquito. "Shall we get on with it?"

"Well, I suppose we should wait for the nymph and her little pet.¹ Kind of pointless to start without them, isn't it?"

"Shh, listen—here she comes!"

The sudden scent of wildflowers blew by upon a spring breeze, accompanied by a haunting feminine voice singing a wordless tune. The singing stopped as the woman reached the backs of the three men seated together, side by side, on the forest floor. She placed a hand upon the shoulders of both Willowquisp the Zoophile and Spontayne the Studios, and planted a kiss firmly upon Buntleby's bald head. "Hello, gentlemen," she said in a silky voice.

"Azurielle," acknowledged Buntleby.

"I wore a hooded robe, so you needn't worry about looking at me," said

Azurielle, pulling the hood up over her head to hide her unearthly beauty. "It's safe now; you can turn around."

Hesitantly, the three Monster Hunters turned to face her, snatching a quick peek and glancing away. When their vision wasn't obliterated by her supernatural beauty, they dared a longer look, and finally faced her fully. She sat with her legs bent at her side, her hooded robe obscuring her face but doing little to hide the delicate curves of her body.

"My, but you're a twitchy bunch today," she commented with a smile.

"Can you blame us?" griped Willowquisp. "The last time we got a look at your true features, we were all blinded or killed outright."²

"All water under the bridge," said Buntleby, waving a dismissive hand. "We are here now to bring you a warning: Some of our members plan mischief against one of your forest creatures."

While the Monster Hunters couldn't

1. The term "pet" is misleading when used to describe the relationship between a pseudodragon and its companion, as any pseudodragon is quick to point out. There are two ways for a human to become the companion of one of these creatures: Either the human can summon the pseudodragon (via the wizard spell *find familiar*), or the pseudodragon can choose the human. A pseudodragon looking for a human companion uses its inherent telepathic powers to "eavesdrop" upon the minds of candidates. If it likes what it learns, it presents itself and makes its final decision based upon the human's

reaction. (People who express overwhelming joy at the prospect are generally shoo-ins.)

Humans aren't the only race found as pseudodragon companions, although they are the most common. Demihumans (usually elves or halflings; less frequently, gnomes) are occasionally given the opportunity for such an honor, and the forest-dwelling pseudodragons are not against taking as companions members of such sylvan races as nymphs, dryads, or centaurs.

2. See "The Ecology of the Nymph" in *DRAGON Magazine* #240 for all of the sordid details.

see it under the hood of Azurielle's garment, her eyes narrowed to angry slits. "That greedy pig Dreelix, no doubt!" she spat.

Willowquisp's eyebrows shot up and he cast a quick glance in Buntleby's direction.

"Er, yes," admitted Buntleby.

"What's his twisted scheme this time? Chop a treant in half to see if there's anything magical about its sap? Pull the wings off of pixies and grind them into pixie dust? Slice off a unicorn's horn and use it for a magical backscratcher?"

"Nothing so devious," said Buntleby. "He merely wishes to capture a pseudodragon to milk it of its venom."³

"I believe there is also some plan afoot to use the magical properties of its scales in some color-changing magic," added Willowquisp.⁴ "And I think the creature's blood has some magical uses as well."⁵

"Yes, thank you, Willowquisp," said Buntleby irritably. The elderly sage pursed his lips and shut up.

"And how does he intend to capture a pseudodragon?" asked the nymph.

"As to that, I cannot say. I admit, he and I have had our little differences in the past, but I must give him credit for a brilliant mind; the man has a keen intellect and is a clever strategist. I fear my own humble mind might be useless in trying to outwit him."

"I'm surprised at your sudden change of opinion, Buntleby," said the nymph. "Didn't you tell me just last week that Dreelix was a 'bumbling incompetent,' a 'power-hungry blowhard,' and a 'self-aggrandizing buffoon?'"

Spontayne snickered loudly and held his hand up over his mouth. Buntleby glared in his mentor's direction, and Spontayne shrugged an apology, stifling another snicker. "Be that as it may," said Buntleby, "we nonetheless thought it best to come here and warn you of Dreelix's intentions."

"Why don't you begin by telling me what Dreelix knows about pseudodragons, so that we might deduce his intended strategies?" said Azurielle.

"Very well, an excellent idea," spoke Willowquisp.

"Last week, Dreelix had Buntleby and I report on our research on pseudodragons. Dreelix, of course, paid particular attention to the uses of various pseudodragon body parts: the scales, the blood, the venom sac. He is aware

of the quickness with which they can strike with their tail stingers, and he might perhaps have come up with some way to counter that attack."

"How?" asked the nymph.

"Perhaps a type of cork armor," suggested Buntleby. "The pseudodragon would slash out with its tail, get its stinger stuck in the cork, and that would

give everyone enough time to jump it while it was stuck."

"An unlikely scheme," dismissed Azurielle.

"You never know with Dreelix," commented Willowquisp.

"So what else?" the nymph wanted to know.

"Well, let's see. I know we mentioned that pseudodragons are active primarily

3. A pseudodragon has a barbed stinger at the end of its highly flexible tail. The stinger is extremely sharp, like a hypodermic needle, and is attached to a venom sac in the bulbous end of the tail. Pseudodragons are adept at attacks with their stingers, striking at +4 to hit and inflicting no damage with their high-precision strikes. The tail is long enough to permit the creature to attack enemies directly ahead; the pseudodragon arches its tail over its body like a scorpion. Each stinger hit requires the victim to make a successful saving throw vs. poison or enter a state of catalepsy that lasts for 1-6 days. During this time, the victim appears to be quite dead, but there is a 75% chance that he or she wakes up unharmed after the catalepsy runs its course. (The other 25% of the time the victim dies.) The results of all stinger strikes are completely random—the pseudodragon cannot choose to use a lethal dose, and repeated doses of pseudodragon venom have no cumulative effect. As might be expected, pseudodragons are immune to the effects of their own venom.

Pseudodragon poison can be sold for about 100

gold pieces per ounce. A slain pseudodragon yields about 12 ounces from its venom sac; living pseudodragons can be "milked" (against their will; they see the process as extremely demeaning) for about 20 ounces a week.

4. Although their scale coloration is normally a reddish brown, pseudodragons have a chameleon-like ability to alter their colors to blend in with the local environment. This is done through specialized cells, called chromatophores, imbedded in the skin. The pseudodragon's outer skin consists of many tiny, translucent scales made of keratin (the same substance that composes human hair and nails). Layers of skin directly below the scales contain fixed blobs of reddish-brown color and free-floating blobs of a darker substance, melanin. The pseudodragon alters its coloration by means of nerve impulses directing the positioning of the melanin granules: By spreading throughout the cells, the darker melanin obscures the red pigmentation and causes a color change in the pseudodragon. There are several layers of skin, each with a different shade of melanin,

allowing the pseudodragon to become green, brown, black, or shades between. A pseudodragon's skin need not be all the same color at once, either, for it can create camouflage patterns to aid it in blending into the forest environment. Because of these chameleon abilities, a pseudodragon has an 80% chance of remaining undetected in a forest environment by creatures unable to see invisible objects.

As a result of these abilities, pseudodragon skin can be used in the production of *rings of chameleon power*, *potions of rainbow hues*, and *cloaks of elvenkind*.

5. Pseudodragon blood is often used in the creation of *rings of spell resistance*. This is due to the highly magical nature of the pseudodragon: It not only has a 35% magic resistance but can also transmit this resistance to its companion through physical contact. Many pseudodragons enjoy perching on their companions' heads or shoulders; it gives the pseudodragon a good view, grants the companion the 35% magic resistance, and, by letting the companion do all the walking, subtly reminds the individual of his or her true place in the relationship.

in the daytime, so we can expect him to attack during the daylight hours.⁶ He knows that pseudodragons are omnivores, so maybe he'll try trapping it using a piece of meat for bait or something."⁷

"Is he aware of their telepathic abilities?"

"Oh, definitely," replied Buntleby. "I know he wouldn't want the pseudodragon reading his mind, so he'll probably take some kind of countermeasure as a precaution: a ring of mind shielding or something similar. Anything else I'm forgetting?"

Willowquisp spoke up. "Well, as usual, I tried briefing him on pseudodragon mating habits but was rebuffed. Dreelix doesn't care to hear about that sort of thing, as it usually has no bearing on how to capture the monster in question or what to do with it once it's been slain."⁸

"Did he mention plans to counter its camouflage ability?" asked the nymph.

"Faerie fire would be the obvious choice," commented Willowquisp, "But

as that's a priestly spell, it's not available to Dreelix—or any of the other wizards in the Association. I suppose he could cast a light or continual light spell on it, so that it would remain illuminated no matter how it tried altering its scale coloration."

"Also, I know we mentioned that the creatures molt," added Spontayne. "Maybe he planned on attacking it while it was molting, and at somewhat of a disadvantage."⁹

Azurielle breathed a sigh of exasperation. "I can't believe even Dreelix would want to hurt as playful a creature as a pseudodragon," she lamented, shaking her head sadly. "They're almost as care-free and happy as faerie dragons."¹⁰

"Is your pseudodragon nearby?" asked Buntleby. "I'd hate to think of crafty Dreelix creeping up on him while we sat here discussing strategies."

"He's been here the whole time," commented the nymph offhandedly. The Monster Hunters looked around in vain. "Up there," she added, flicking a graceful hand in the air above her head.

The Monster Hunters looked up and, after much searching, could gradually discern what appeared to be a green and black mottled face among the branches of the trees, its yellow, reptilian eyes staring down at them with feverish intensity.

The pseudodragon leapt down from its perch in the branch overhead, and leathery wings flapped it safely to the ground. It walked over to Azurielle and sat by her side, keeping a wary eye on the three Monster Hunters. "It's okay, Cuddles, they're friends," replied the nymph.¹¹

Keeping its yellow eyes on the three strangers, the pseudodragon altered its coloration; the green and black mottling that hid it so well among the foliage of the trees became a reddish-brown. It twitched its tail back and forth, as if reminding everyone present to behave themselves, then yawned impressively, showing off its rows of razor-sharp teeth.¹²

"Amazing," remarked Spontayne. "A truly impressive creature."

"He's a cutey, all right," Azurielle

6. This is because pseudodragons, like all reptiles, are cold-blooded and rely on external conditions to regulate their own body temperatures. Pseudodragons bask in the sun (a favorite pastime) to increase their temperatures and hide in the shade when they get too hot. At night, when the temperature drops, the creatures become sluggish, striking at -2 to hit. They prefer spending the night in the safety of their lair: a hollow tree, cave, or even an underground burrow. (They'll lair in abandoned burrows, but do not dig burrows of their own.) Here they store their treasures (any bright, shiny thing they come across in their travel): bits of colored glass, polished pieces of metal (including coins), and especially gemstones of all sorts. (A typical pseudodragon lair contains ten times the normal amount of Treasure Type Q, plus frequently Treasure Types J, K, or M as well.) Pseudodragons value their treasures because of their attractiveness rather than for their inherent value; a highly polished copper piece is worth far more to a pseudodragon than a tarnished gold piece.

During winter, the pseudodragon hibernates in its lair, sleeping through the coldest season and awakening in the spring when it warms up.

Although the pseudodragon prefers daytime activity, it has excellent night vision. Pseudodragons possess infravision with a range of 60 feet and can see invisible objects (including other camouflaged pseudodragons).

7. While omnivorous, pseudodragons prefer meat above all else. Their diet consists primarily of rodents and small birds, and when those aren't available, leaves, fruits, and berries. Pseudodragons are somewhat finicky eaters and refuse to touch carrion.

8. Pseudodragons are solitary creatures, coming together only in the springtime to mate. During mating season, it isn't unusual to find gatherings of dozens of pseudodragons together. For 3 days, the small pseudodragon horde does little else, changing partners frequently and stopping only long enough to grab a quick bite to eat. They are extremely irritable toward trespassers during this time (especially

the males) and immediately attack any intruders. At the end of the 3-day ritual, each pseudodragon flies off to its own territory.

Shortly thereafter, the females lay clutches of 4-6 brown speckled eggs that hatch in mid-summer. Because of the pseudodragon mating ritual, it is possible for each of the eggs to have been fertilized by a different male. Once the eggs hatch, the female pseudodragon cares for her young all that summer and autumn, teaching them to hunt and fly and sharing her lair with them. They hibernate together all winter; in the spring the young fly off to establish their own territories and start their own adult lives. Pseudodragons live for 10-15 years.

Pseudodragon eggs can be sold for as much as 10,000 gold pieces on the open market. Hatchlings can fetch up to 20,000 gold pieces to the right buyer. (Wizards, especially those without access to the *find familiar* spell, are the primary target audience.)

9. Like most reptiles, pseudodragons continue to grow throughout their lives. While their first year's growth spurt is fairly rapid, the growth cycle slows down after that and the creature's size increases at a much slower rate for the rest of its life.

As the pseudodragon's body grows, it gets too big for its skin and it sheds the outer layer. Unlike a snake, however, which usually crawls out of its old skin all at once and leaves it fairly intact (although inside out), a pseudodragon's old skin flakes off in bits and pieces. Anyone hoping to stumble across a pseudodragon floundering about as it struggles out of its old skin is in for a disappointment; since the skin flakes off in pieces, the pseudodragon is in no way hampered by the process. The creature aids the process by rubbing up against rocks, the hardened bark of ancient trees, and so forth.

A newly hatched pseudodragon sheds its skin monthly for the first year or so, then about twice a year thereafter. Males tend to grow somewhat larger and faster than females, but not noticeably so.

10. The faerie dragon is a chaotic offshoot of the pseudodragon race. While roughly the same size, the faerie dragon's wings are those of a butterfly

instead of those of a dragon, and it lacks the pseudodragon's poisonous tail stinger. Their scales change color throughout their lives as they age; instead of the pseudodragon's chameleon abilities, the faerie dragon goes one step further with full invisibility. They share the same love for practical jokes, although with a faerie dragon's genius-level intelligence and spell use, their pranks tend to be even more elaborate than those of pseudodragons.

On the other hand, the faerie dragon is a strict herbivore, subsisting solely on fruits, nuts, berries, honey, and grains. Unlike pseudodragons, a faerie dragon's innate magic resistance increases as it ages. Finally, it has developed a gaseous breath weapon and prefers the company of sprites and pixies over human or demihuman companions. Despite their differences, though, pseudodragons and faerie dragons enjoy each others' company.

11. Pseudodragons have no spoken language, communicating among themselves via telepathy. While they have individual "names" that they use among themselves, these names are complicated to translate into a spoken tongue. As an example, a pseudodragon's "thought-name" might be "Playful Investigator-Who-Once-Got-His-Nose-Stuck-in-a-Beehive-and-Tried-Cornering-a-Skunk-in-a-Cave-That-One-Time." The "thought-name" is expressed instantly telepathically but is cumbersome when spoken aloud. Therefore, pseudodragons with human companions frequently allow themselves to be given a human "pet" name, often a childishly silly one—"Snooky," "Pookums," or "Boo-Boo," for instance. Pseudodragons revel in the "cuteness" of their pet names and often brag among themselves over who has the cutest name.

12. The teeth of a pseudodragon jut from the jaws, extending beyond the lips even when the creature's mouth is closed. The teeth are irregularly spaced, somewhat like a crocodile's, and inflict 1-3 points of damage upon those enemies bitten. Although pseudodragons have tiny claws, they are not used in combat. Rather, they help the creature keep its perch in tree branches and aid it in climbing.

agreed, bending over to scratch it behind its horns.¹³ "Aren't you, my widdle cutesy-wootsie-wookums?" The pseudodragon purred in delight.¹⁴

"Do you think Dreelix will be after this particular one?" asked Spontayne.

"Probably," replied Buntleby. "It's the only one he knows of specifically. I'm sure he figures there are a bunch of them somewhere in the forest, but it's a big forest, and he knows where Azurielle likes to hang out. If he knows that she has a pet pseudodragon—"

The pseudodragon growled in anger at Buntleby.

"I mean, of course, if he knows that she's got a pseudodragon as a valued companion ..." Buntleby amended; the pseudodragon snorted his acceptance of this version of events. "... then it's only logical to assume that he'll try to capture, uh, Cuddles here," he finished.

"I suppose that makes sense," sighed the nymph sadly, looking down at her scaly friend and rubbing him underneath his jaw. "When do you think he's likely to attack?"

The three Monster Hunters looked sidelong at each other; Spontayne gave Buntleby a nearly imperceptible nod.

"Well, knowing Dreelix," began Buntleby, "probably—*now!*"

The three Monster Hunters sprang as one onto the nymph and her reptilian companion. Buntleby snatched the pseudodragon's tail near the tip, just below the bulbous venom sac; Willowquisp grabbed at its neck, near the jawline, and clamped its mouth shut with one hand. Spontayne, meanwhile, leapt spread-eagled onto Azurielle, pinning her underneath his body. He grappled with the hood of her garment, holding it shut with one hand while he hugged her close to his body with the other arm, preventing her from fleeing or using her innate dimension door abilities to escape. "No blinding us this time!" he chortled to the nymph.

"What are you doing? What do you want?" cried the nymph. Muffled by her robe and Spontayne's hand, it came out more like

"Mutt are oo dune? Muttu oo watt?"

Buntleby, apparently, had no trouble making out the nymph's questions.

"The pseudodragon, of course. He comes with us, we let you go, you don't try interfering with us. As simple as that." He and Willowquisp held the prone pseudodragon at arm's length between them; Willowquisp gingerly transferred custody of the creature's head to Buntleby, and the wizard stood with one hand on the creature's tail and one hand around its neck. "Try anything, and your little pal here pays the price. All we want is a little venom, a little blood, and maybe a scale or two. We'll even give him back to you when we're done, pretty much none the worse for wear. How does that sound? Do we have a deal?"

Azurielle gave a cry of frustration and tried pulling free of Spontayne's grasp, to no avail.

"You really are being most unreasonable," said Buntleby. "And here I've gone out of my way to be nice."

"All right, I think this has gone on far enough," replied the pseudodragon, shifting form.

Buntleby stood, mouth open in shock, as the body of the winged lizard he held began flowing, altering, changing. In the space of a heartbeat or two, he found himself grasping no longer a lizard but a wizard, one identical in all respects to himself, right down to the bald head.

"Buntleby!" said Buntleby in astonishment, letting go of the newly formed wizard and taking an involuntary step backward.

"Hello, Dreelix," replied Buntleby—the real one. "I believe the jig is up, as they say."

Face red, the fake Buntleby's facial features changed, repositioning themselves into Dreelix's scowling countenance. His frame also dropped several inches in height, and he was forced to look up at the man he had just been caught impersonating.

"Why are—? When—? How did—?" he spluttered.

13. With the exception of the lengthy stinger-tipped tail, pseudodragons resemble tiny red dragons. Like red dragons, they have impressive horns jutting back from their heads, but these are not used in combat. They also have a frill of hardened skin on either side of their narrow faces; this frill joins with

the two large horns at the top of the head and connects them to each other as well. The horns and frills are permanent fixtures to the pseudodragon's skull and are not shed when the creature molts.

14. While they have no spoken language, pseudodragons can make a wide variety of vocalizations to

express their moods. Among their repertoire: a rasping purr, denoting pleasure; a sibilant hiss, like that of a snake, expressing unpleasant surprise; a bird-like chirp, denoting desire (pseudodragons often "chirp" at their companions when begging for food scraps); and a throaty growl when angry.

"I figured you'd try something like this," Buntleby explained. "So Azurielle and I made sure we were ready for you. Cuddles trailed you all the way through the forest, and projected the images directly to Azurielle.¹⁵ Of course, since I was already with her, she realized that you had to be a fake."

Dreelix fumed, his face turning redder by the moment. A vein started throbbing at his temple, and he was unable to form coherent words yet, although his lips twitched and his teeth ground together, as if fighting to hold them in. He remained silent.

"So now what do we do?" inquired Willowquisp, his features sloughing off and becoming those of gangly Zantoulios. He swallowed self-consciously as he looked over at Buntleby, a sheepish, sickly grin on his face.

"I'll tell you what you do," snapped Buntleby. "One, you get off of Azurielle, Grindle. It is Grindle, isn't it?" Spontayne looked guiltily up at Buntleby and nodded. He released his illusion and immediately went from a tall, lanky wizard in fashionable robes and sporting an impressive black mustache, to a vastly overweight wizard with jiggly folds of flesh depending from his upper arms and stains from his most recent meal visible on the worn robe covering his prodigious belly. Grindle looked down in shame but retained his hold on the nymph as if frightened to let her go.

"Two," continued Buntleby, "The three of you apologize to Azurielle for your atrocious behavior, and beg for her forgiveness. Three, you hightail it out of the forest and never, ever set foot in Azurielle's grove again!"

"Forget it, Buntleby!" snapped Dreelix, finding his words at last. "I came here for a pseudodragon, and I'm not leaving here without one! Grindle! Hold her steady; don't let her escape. It's still three against one, Buntleby; like those odds? Now then, nymph, I'm

going to count to three, and if you know what's good for you, you'll have produced your little Cuddles—the real one, this time, no tricks—otherwise, this little forest of yours and a few of my fireballs will become very well acquainted."

"You wouldn't!" the nymph screamed. It came out "Oo oodint!" from beneath Grindle's chubby hand.

"You're bluffing," said Buntleby. "Not even you would be that mean."

"One," counted Dreelix. And to Buntleby: "I never bluff."

"Stop him!" screamed Azurielle. "Op im!" is all that came out.

"Last time, you threatened to stomp on baby bunnies if Azurielle didn't do what you asked, but you didn't do that, either, Dreelix. Personally, I think you're just a big softy inside."

Dreelix was starting to sweat, knowing that he wouldn't really burn down the forest just to obtain some pseudodragon fluids for experiments. He knew that, and Buntleby—curse him!—knew it too, but the silly nymph didn't, and that was all that mattered. If Buntleby hadn't shown up to spoil things, he'd have his pseudodragon by now and everything would be fine! But no, here was Buntleby calling Dreelix's bluff, and in front of two other Monster Hunters, no less! Trying to make Dreelix look stupid, was he? Like an ineffectual leader? He'd have to show them who was boss!

"Two," he snarled.

"Well, you've made your choice," replied Buntleby, shaking his head sadly. "Get 'em, boys!"

Dreelix got as far as "Thr—" before the branches overhead exploded in a swarm of movement. At first it looked like the local flora was undergoing the rites of autumn all at once, dropping a season's worth of leaves in one fell swoop. Then the dropping shapes began changing color, from greens and browns and black to a familiar reddish-brown. No fewer than six angry pseudodragons

swarmed all around the gathered party, stinger-tipped tails stabbing left and right at the three renegade Monster Hunters.¹⁶

Grindle took a hit in his rump and collapsed, landing on Azurielle and eliciting a whoof of expelled air from her. Zantoulios hid beneath wildly swaying hands, ducking from the enraged lizards and trying to fend them off. He, too, was ultimately unsuccessful and slumped over after taking a hit or two.

As might have been expected, Dreelix was the last to fall. One pseudodragon dived at him tail first, a malicious grin spread across its reptilian face. There was a solid *thunk* as the creature's stinger stabbed at the wizard's chest. Instead of falling over, however, the wizard just grinned back at the surprised beast. The creature's surprise intensified when it realized its tail was stuck fast, and it flapped its wings furiously trying to stay aloft. Dreelix slapped it mercilessly in the face.

Another pseudodragon hit Dreelix in the back, with similar results. It wasn't until a third creature managed to stab the wizard in the side of the neck that Dreelix fell over with a look of complete shock on his face, dragging the two struggling but stuck pseudodragons down with him.

Buntleby came quickly to their rescue, gently pulling their tails from the unconscious wizard's robes. "I'll be darned," he exclaimed, pulling open Dreelix's robes at the neck. He removed a dart board that the wizard had been wearing on a strap around his neck; there was another under his robes at his back. "Cork armor. Who'd have thought?"

Azurielle had finally managed to extricate herself from Grindle's unconscious form, and she walked over to Buntleby's side. "What are we going to do with them now?" she asked.

"You leave that to me," Buntleby replied.

15. If a pseudodragon opts to take a human companion, it can transmit everything it hears and sees to its partner, so long as the two remain no more than 240 yards apart from each other. This allows the companion to use the pseudodragon as a spy, gaining the creature's infravision and invisibility-detection abilities while it is so linked. Once established, the audio-visual link can be broken by either of the two participants at any time, at will.

A pseudodragon can "link" with only one individual, its chosen companion; once the bond of companionship has been established, the pseudodragon is unable to "link" with anyone else, unless the companion is slain and the pseudodragon elects later to take on another. This makes choosing the right companion a very serious matter to the pseudodragon, as once a companion is chosen, the bond can be broken only through the death of one of the participants.

16. Although pseudodragons are normally reclusive creatures, they aren't against banding together in numbers when the need dictates. They are, after all, neutral good, with an intelligence equal to that of the average human. And if a forest nymph requests aid from a pseudodragon, even one to which she is not "bonded," it's a good bet that the pseudodragon will respond to the best of its abilities.

Buntleby, sitting at the head table of the meeting hall, tapped three times on the table with Dreelix's beloved gavel. "I hereby call this session of the Monster Hunters Association to order," he intoned in a close approximation of Dreelix's voice.

"What's going on? Where's Dreelix?" asked Lady Ablasta, a look of concern on her face. Lady Ablasta was set in her ways and didn't much like change, if she could help it. Clearly, the Association president's sudden replacement had thrown her for a loop.

"Oh, he's here," replied Buntleby. "But I'm afraid he won't be able to attend to his usual duties this week, so I'm graciously standing in for him. Willowquisp? Spontayne? Are you ready?"

"Ready," they replied in unison and approached a hastily hung curtain from behind the head table.

"My fellow Monster Hunters," began Buntleby, "if you'll recall, last week Dreelix asked Willowquisp and me to brief the Association on our findings after researching the pseudodragon. We were concerned about his ultimate plans, and he told us not to worry about them. Well, it seems our illustrious leader got a little ahead of himself, deciding to take matters into his own hands. This, alas, is the sad result."

With a flourish, Willowquisp and Spontayne pulled back the curtain. There was a unified gasp from the audience as the Monster Hunters got a good look at what was on exhibit there.

Dreelix, Grindle, and Zantoullios stood motionless, propped up against the wall and staring ahead at nothing. Dreelix was positioned with a finger up his nose, Zantoullios was sucking his thumb like a baby, and Grindle was apparently captured in mid-scratch, his right hand poised at his left armpit.¹⁷ Each wore a torn and tattered robe filled

with the telltale holes of bite marks; scratches covered their bodies, and dried, reptilian dung was smeared on their faces. On a placard around each of their necks, printed in Buntleby's precise handwriting, read the inscription: "We should have known better."

Old Gumphrey, easily the oldest of the Monster Hunters, cackled aloud in glee at the sight. "Look at that!" he chortled.

"I believe we can now officially state for the record that the Monster Hunters will not be pursuing the pseudodragon line of research in the future," said Buntleby. "And perhaps at next week's meeting the trio standing before you will feel up to talking and can give you their side of the story. In the meantime, here's what I saw of the events..."

There was absolute silence in the audience, as each of the assembled wizards and sages of the illustrious Monster Hunters Association strained to hear Buntleby's every word.

If Dreelix could hear Buntleby, he gave no indication of it.

Johnathan M. Richards was quite shocked to realize that this article marks the eighth appearance of the Monster Hunters Association. Fans of the series can find their previous entries in DRAGON® Magazine issues #227 (osquip), #240 (nymph), Annual 2 (shambling mound), #246 (flumph), #258 (flail snail), #261 (dark naga), and #262 (jermlaine).

17. Victims of pseudodragon venom enter a cataleptic state, known for a loss of voluntary control of the muscles and an overall muscular rigidity. While in this state, the victim's body can be moved into any position and the victim will remain like that until the catalepsy ends. Circulation, respiration, digestion, and similar organic functions continue during this time, but they are slowed down to such a rate that the victim might appear dead.

Pseudodragons, being pranksters, take full advantage of this quality of their venom to place their helpless victims into a variety of amusing posi-

tions. The victims usually fall over when stung, and since a pseudodragon lacks the strength to lift a human to his or her feet, the creature must make do with humorous prone positions. Favorites include the "I'm swimming on dry land" position, the "I'm trying, but I can't even do one push-up" position, and the perennial favorite, the "Dead bug" position (victim lying on his or her back with arms and legs sticking straight up).

Pseudodragons frequently make full use of multiple victims. A party of three cataleptics might be arranged in the "see no evil, hear no evil, speak no

evil" pattern; a party of four victims might be arranged in a square to give the appearance that each is sleeping soundly, using the belly of a friend as a pillow. With enough victims, a pseudodragon might even try spelling out short words.

Since pseudodragon-induced catalepsy can last up to 6 days, the victim might exit the state with exceptional hunger, thirst, and weakness, and might have bedsores if he or she was left in one position for too long.

THE ECOLOGY OF THE

PURPLE WORM

BY JOHNATHAN M. RICHARDS · ILLUSTRATED BY DENNIS CRAMER

Dreelix tapped his trusty gavel three times upon a handy flat rock. "This field session of the Monster Hunters Association is hereby called to order," he intoned. Then, with a practiced flourish, he slid the gavel into a pocket of his robes with one hand while pulling

Buntleby. "I hope you at least cleaned out the portable hole since we used it to carry hydra parts over to Old Gumphrey."

Grindle stopped short in sudden shock, midway in the action of unfolding his portable hole. "I . . . meant to get around to it," he said lamely, plopping the now-open hole down onto the dusty ground.

Grindle!" demanded Dreelix irritably. Turning to Buntleby and Rhionda, he added: "Suit yourselves, then. But my carpet only seats four, as you well know. If you wish to be left behind, that's your business, but the rest of us have a date in a purple worm's lair!"¹

"Hold on," said Rhionda, as Grindle folded up his hole and stashed it in a pocket of his robe. "Do you have one of your polymorph self spells ready, Bunt?"

"Yeah."

"Well, no problem, then. Turn into an eagle or something and follow along."

"And what about you?"

In response, Rhionda fished into her pack and produced a slim line of silken rope. Tying one end around her slender waist, she tossed the other end to Grindle, who now sat cross-legged on Dreelix's carpet with his prodigious belly resting on his massive thighs. "Here, hold this," she said. Grindle

complied, and Rhionda rose a couple inches off the ground, courtesy of her boots of levitation. "All ready here," she said. "You coming, Bunt?"

Buntleby frowned in frustration and began the words to his spell. By the time his features had melted into those of a giant eagle, Dreelix had lifted his carpet from the ground and was speeding along toward the mountains north of the city, pulling Rhionda behind like some airborne water-skier. Buntleby shook his head in amazement, flapped his wings, and followed swiftly in pursuit.

A HIDEOUS STENCH ROSE FROM THE CONFINES OF THE HOLE, A STINKING MIASMA OF ROTTING HYDRA FLESH.

his rolled-up carpet of flying from his back with the other. A quick flick of his wrists and the carpet unrolled flat on the ground between the feet of the Conjurer Ablasta, Grindle the Coin-Counter, Zantoullios, and himself.

"All aboard that's getting aboard," he said, stepping onto the carpet before even finishing the sentence. The other three stepped on as one, leaving Buntleby and Rhionda standing together out of immediate reach of the carpet. "Looks like you two get the cheap seats again," Dreelix snickered.

"What a surprise," grumbled

Immediately, a hideous stench rose from the confines of the hole, a stinking miasma of rotting hydra flesh. All of the Monster Hunters (save Grindle) screwed their faces into expressions of disgust; Lady Ablasta yanked her perfumed handkerchief from a puffy sleeve and held it over her nose.

"There's no way I'm crawling into that disgusting thing!" said Buntleby into his palm, which was currently covering both nose and mouth.

"Me neither!" agreed Rhionda from a similar position.

"Ugh, fold that nasty thing back up,

The miles flew by quickly. In less time than would have been thought possible, Dreelix dropped his flying carpet toward a fissure in the side of a mountain. Zantoulios cast a quick light spell on the tip of his collapsible staff as they entered, and Buntleby, seeing what was coming, did a quick aerial polymorph from giant eagle to tiny bat. Then the Monster Hunters were whizzing through underground passages, with Lady Ablasta shrieking in fear as Dreelix cut a few corners close and Rhionda whooping in delight as she was pulled aloft. Bringing up the rear was Buntleby in bat form, little wings flapping rapidly in an effort to keep up.

Passing through various connected underground caverns, Buntleby found himself dodging and swerving around low-hanging stalactites. Then Dreelix's carpet took a quick dive to the right, into a narrow, circular tunnel with smooth sides.* This new tunnel twisted and turned, eventually spilling out into an enormous cavern.

This, apparently, was their destination, for Dreelix slowed down the magic carpet and let it glide to the floor. "At least his landings are getting better," gasped Lady Ablasta, her hand to her heart as if ensuring that it hadn't burst in fright during Dreelix's reckless underground piloting. She shakily got to her feet with help from Zantoulios, while Grindle passed the rope back to Rhionda. "That was great!" she exclaimed with enthusiasm, untying the rope from her waist. "We'll have to do that more often!"

Buntleby flapped to the floor and resumed his normal form. He bent over to catch his breath, leaning heavily on Grindle. "Easy . . . for you . . . to say," he gasped. "You didn't . . . have to fly over here . . . on your own power."

"So where exactly are we?" asked Zantoulios, extending his glowing staff in all directions. The cavern was much too large for any but the tiniest section at a time to be illuminated by the power of his spell. "And where's the worm?"

"He must be out hunting,"³ said Dreelix matter-of-factly. "But don't worry, he'll be back—and when he shows, we'll be ready for him!"⁴

"Maybe we can loot his burrow in the meantime, then!" suggested Zantoulios. "Uh, do purple worms keep treasure?"

"Not that I'm . . . aware of," said Buntleby, still catching his breath. He cast a light spell on a small pebble and used it to take a quick look around a portion of the enormous cavern.⁵ "But it wouldn't hurt to look, I guess. Hey, look at this!"

Dreelix ran quickly to Buntleby's side, eyes darting greedily about in search of whatever treasure Buntleby might have unearthed. "What? Where? What?" he said, head turning this way and that.

Buntleby held out his shining pebble. "Look! An underground pool of water. Neat, huh? I thought I heard water dripping. I wonder how far out it goes?" The water extended farther than the range of the wizard's light spell, but he got the sense that it went on for some distance.

"Pshaw!" scoffed Dreelix and turned away.

Buntleby called Grindle over by the water's edge. "Hole," he demanded, holding out his hand. Sheepishly, Grindle passed it over. "Anything in here you don't want getting wet?" asked Buntleby.

Grindle unfolded the portable hole, reached in with one hand, and brought out his lengthy spear. "Spear," he said, placing it on the stone floor of the cavern, then reached back inside the extradimensional opening. When he retracted his arm it was

GAME NOTES

I A purple worm lairs in underground burrows. Given the worm's enormous size, these lairs are often gigantic. There is usually only one entrance to the lair, dug by the worm itself, but this often branches off in several directions some distance from the lair.

2 Purple worms tunnel through packed earth and solid stone, leaving behind passageways the width of their own bodies. Dirt and stone pass through the worm's simple digestive system and are ejected from the body after the worm has extracted any nutrients from the substances. The round tunnels left behind are common near purple worm lairs, often crisscrossing and penetrating into pre-existing caverns. Occasionally, a purple worm's tunnel breaches the surface world. This effect benefits those dwelling in the Underdark, creating new air shafts.

Such is the worm's efficiency at burrowing that its speed remains constant whether crawling upon a flat surface or digging its way through the earth.

3 Purple worms are opportunistic hunters, chasing down anything edible that crosses their path, but they do not go out of their way to find living food, for they extract sufficient nourishment from the dirt and stone of their underground environments.

4 Despite Dreelix's use of masculine pronouns, purple worms are hermaphroditic, each creature having both male and female sexual organs. The male organs are several segments in front of the female organs, toward the front of the worm's body. This arrangement allows any two purple worms to breed: They line up their bodies in opposite directions and fertilize each other's internal eggs.

During the mating process, the worms produce a great amount of the slimy mucus their bodies normally exude. This thick coating actually adheres the worms to each other while they mate; the entire process often takes several hours. Afterward, each crawls away to its own lair, where it secretes its eggs wrapped in a mucus cocoon.

Purple worms mate only once a year.

5 Purple worms have no concept of treasure. Nonetheless, their lairs often contain riches, if one knows where to look.

As purple worms burrow through the ground, they swallow vast amounts of dirt and stone. In mineral-rich areas, a purple worm might also be chewing its way through veins of copper, silver, gold, or other valuable ores. These ores are ejected, along with other detritus, in the worm's castings. Purple worm castings look like piles of wet dirt and are commonly found in the worm's lair.

There are more dignified methods of striking it rich than digging through purple worm dung, but the end results are often worth it. Occasionally, items from devoured adventurers make it through a purple worm's digestive tract relatively intact; these might include rings, metal armor and weapons, and the like, but nothing easily digestible like scrolls, leather or cloth goods, and so on.

Finally, a purple worm's gizzard often contains several gems or other acid-resistant valuables that are used to help the creature grind up its food. These items are usually embedded in the walls of the creature's gizzard, so retrieving them is only possible after the worm has been slain.

carrying a small cloth bag. "Snack," he identified, then passed the hole to Buntleby.

"Is that it?" asked Buntleby, holding his nose to keep out the rancid stench of overripe hydra. Grindle nodded his assent while reaching into his snack pouch and pulling out a sticky pastry. Buntleby shook his head, made a face

licking his fingers clean after his snack. "I'd let the thing soak," advised Buntleby, to which Grindle replied with a grunt and a nod. "We can pour it out later, and hopefully we'll have rinsed out the worst of the smell." Grindle dropped it back into his pocket and continued licking the frosting from his fingertips. He reached back into the

Dreelix stood side by side facing the worm-dug entranceway, through which, presumably, the purple worm would re-enter its lair. Behind them sat the Conjurer Ablasta, preparing a arcane eye spell. Rhionda stood behind her, overlooking the trio, ready to flash the longsword strapped to her back into action should the need arise. She held Zantoullios' glowing staff so the gangly wizard's hands were free for spellcasting.

"There you are, Bunt," she said as the young wizard approached. "Why don't you take up position here by Zantoullios, and Grindle can stand over there by Dreelix. You guys got your combat spells all ready?"

"Sure. How long do you think we have to wait?"

"No telling. But we'll be ready for it. With Lady Ablasta's arcane eye spell, we'll have a few moments' notice, so we shouldn't need to waste time with any hold monster spells. We oughtta be able to blast the thing before it's all the way out of the tunnel. You ready with that arcane eye yet?"

"Yes," sniffed Lady Ablasta. "I'll send it off down the tunnel as far as I can, and let you know when I spot

WATER STREAMED FROM THE MOTTLED SURFACE OF ITS GLISTENING, ARMOR-PLATED HIDE.

of disgust, and pitched the portable hole into the water. Bubbles leapt to the surface as the extradimensional interior filled with water. Rolling up the sleeves of his blue robe, Buntleby carefully folded the hole back up underwater and returned it to Grindle, who was busy

bag, then thought better of it and stashed it into another pocket for later.

Surprisingly, the rest of the Monster Hunters had actually been busy during this time. Buntleby looked on in appreciation as Rhionda positioned the wizards to best effect: Zantoullios and

anything." She closed her eyes in concentration, and her magic construct flew down the passageway.

"Now, when the thing shows up, you guys hit it with everything you've got," said Rhionda. "We definitely want to kill it before it crawls all the way in here, so we don't have to worry about its tail stinger."

"Is it . . . dangerous?" Zantoulios asked, Adam's-apple gulping its way down his scrawny neck.

"Yeah, kinda," replied Rhionda. "Not only is it wickedly sharp, but it's coated with poison.⁶ Best if we don't have to deal with it."

"Well, I wish the stupid thing would hurry up and show itself," grumbled Dreelix. "I'm getting tired of waiting. See anything yet, Lady Ablasta?"

"Nothing," she replied curtly.

As if on cue, a great surge of water spilled from the underground pool behind the Monster Hunters. Startled, they spun around to see what all the commotion was about.

It was a worm—the largest any of the wizards had ever seen. Water streamed from the mottled surface⁷ of its glistening, armor-plated hide as it wriggled onto the stone floor of the cavern. Then it surged forth like an avalanche, mouth open wide in anticipation of a quick meal of bite-sized morsels. And what a mouth it was! Jagged teeth grew out from the same armor plating that covered the beast's body, curving together into a complex arrangement that met at the front of the creature's face. Buried behind thick ridges were four primitive eyes, two to a side, that glinted in the magical light spilling from Zantoulios' staff and Buntleby's glowing pebble.⁸ A long spike jutted from the worm's lower jaw, pointing at the assembled Monster Hunters as if choosing the beast's next meal.⁹

Several things happened all at once. Dreelix bleated in terror

6 A purple worm's tail stinger deals piercing damage and forces the victim to make a successful Fortitude save (DC 24) or take 1d6 points of temporary Strength damage. Regardless of the result of the first save, the victim must attempt a second Fortitude save 1 minute later or take an additional 2d6 points of temporary Strength damage.

A purple worm causes 2d6+6 points of damage with its tail stinger.

7 Purple worms "breathe" through the pores of their skin. (In fact, they can only continue to do so as long as their skin remains moist, which is one reason they're seldom seen on the surface: Too much sunlight dries up their mucus coating.) They extract oxygen equally well from both air and water and can be found in either environment. While underwater, their skin takes on a mottled look as the water washes some areas clear of their mucus coating. In fact, for years it was believed that the "mottled worm" was an aquatic variety of the purple worm. That this belief went unchallenged for so long is not surprising, as few individuals could get within observing range of a "mottled worm" without becoming the creature's next meal.

8 A purple worm's four eyes are situated equidistant around the circumference of its head, with each eye pointing forward. Thus, the creature can only see what is directly ahead of it. Thick, bony ridges protect the eyes from the worst of the dirt and stones they're liable to come into contact with in an underground environment. The eyes have no lids, remaining open at all times—even when the worm sleeps. However, since purple worms have poor vision and rely primarily upon their tremorsense, they seldom awaken as a result of visual stimulus.

9 The prominent jaw spike is a feature possessed by the worm even before hatching. The spike is initially used to assist the worm in escaping from its egg; later, the worm uses it to loosen up the rock and soil where it wishes to burrow. While iron-hard and as strong as the creature's powerful teeth, the jaw-spike is not used by the worm as a weapon, as it isn't particularly sharp.

and scrambled backward, arms flailing wildly. He bumped into Grindle just as the heavyset wizard spouted off the final words to a fireball spell. Grindle's fireball was inadvertently sent screaming straight up to explode along the cavern's high ceiling and sent a cascade of stalactites plummeting down upon the hapless Monster Hunters. Zantoulios, meanwhile, sent a barrage of magic missiles streaming at the purple worm, while Buntleby grabbed up the conjurer Ablasta, still sitting motionlessly amongst all of the commotion. Ablasta's eyes were closed as she strained her senses through her arcane eye at the far end of the entrance shaft, oblivious to the

his own, but Grindle saw that Buntleby would be in the middle of the spell's effect and jostled Dreelix's arm just in time. Dreelix's fireball went screaming into the underground pool, raising an explosion of steam. A fine mist of hot water sprinkled down over the area.

Dreelix turned to berate Grindle for making him miss his shot, but the expression on the heavyset wizard's face made Dreelix turn to see what had caught his attention. Buntleby had reached the monster worm and without a moment's hesitation dived straight into its open maw. "What in the Nine Hells does that idiot think he's doing?" cried Dreelix in consternation. "I'm not paying to have him raised!"

"Dammit, where's my sword? Maybe we can cut our way out of here."¹⁴

"Got an even better idea," said Buntleby, as he wrapped one arm around her shoulder and began the words to a teleport spell.¹⁵

The two disappeared from the belly of the worm and reappeared instantaneously in the creature's lair, near the entrance tunnel. Buntleby leapt to his feet and helped Rhionda unsteadily to hers, still woozy from the blow to her head. From that vantage point, they could see that the other Monster Hunters weren't faring so well. The worm had survived the onslaught of offensive spells and seemed little the worse for wear. It had dragged its entire body out of the water and coiled up like a rattlesnake. Now it struck at the wizards with both its toothy maw and its stinger-tipped tail. As Buntleby watched in horror, Lady Ablasta just barely dodged the creature's snapping teeth and rapidly scrambled in an unladylike fashion out of the creature's reach. Grindle, all out of combat spells and wielding his spear, wasn't quite as lucky; the worm's glistening stinger stabbed him in a meaty thigh.

Grindle stared down at his leg in astonishment. A small bloodstain began spreading around the wound, staining the robe along the edges of the rip made by the sharp stinger. Grindle's lip quivered in restrained fury. Methodically checking each armpit just to be sure—yep, just as he thought, no sweat-stains: Blast it, this *was* his favorite robe! He dropped his spear to the ground and stomped straight for the purple worm's retreating tail.

The tail struck out again, in a beeline for Grindle's massive form.¹⁶ In a move many would have thought impossible, the heavyset wizard not only dodged the attack but swung a leg up and over the tip of the tail as it struck. Pinning the end of the worm's tail between his thighs, Grindle hooked his legs together at the ankles and grabbed the beast's stinger in both hands.

Sweat beaded on Grindle's forehead as he struggled with the worm's stinger. The creature raised its tail for another strike, lifting the 300-pound wizard into the air as if he weighed nothing, but before it could strike again Grindle gave a roar of triumph and snapped the stinger off in both hands.¹⁷ When the worm's tail struck the ground near

WITHOUT A MOMENT'S HESITATION HE DIVED INTO ITS OPEN MAW.

impending danger barreling her way.

Rhionda just shook her head sadly and calmly pulled the longsword from her back, letting Zantoulios' staff fall to the ground behind her. She faced the approaching worm, ignoring the bumbling wizards behind her and giving her full attention to the fast-crawling monstrosity¹⁸ that even now bore down upon her.

So when the stalactite-chunk dislodged by Grindle's spell whacked her on the back of the head, she was unconscious before she knew what hit her. Rhionda's sword clattered to the stone floor; her own limp form followed immediately thereafter.

The wizards ducked and dodged the sudden rain of ceiling-stone, stumbling away in a desperate attempt to avoid both the falling stalactite pieces and the monster worm. By the time Buntleby had pulled Lady Ablasta to her feet and out of relative harm, he was aghast to see Rhionda's limp body being sucked into the purple worm's mouth like a strand of loose pasta.¹⁹

Without thinking, Buntleby raced toward the creature, screaming to attract its attention.²⁰ Dreelix, in the meantime, had readied a fireball spell of

"Well, he's out of the line of fire now," pointed out Zantoulios. "So let's *get it!*"

As one, the remaining Monster Hunter wizards spilled deadly spells from their fingertips. Wave after wave of magic missiles, fireballs, Melf's acid arrows, and the like pummeled the monster worm, whose hardened skin had attained its uniform purplish coloration now that it had dried out.

Inside the creature's maw, Buntleby was unaware of the magical barrage as he concentrated on crawling deeper into the beast's gullet.²¹ He regretted having left his light-imbued pebble outside in the cavern, but trudged forward blindly on elbows and knees nonetheless. Waves of peristalsis kept crushing him between the walls of the worm's digestive tract. He did his best to ignore it and pressed on. Finally, he reached his goal: His hand brushed what could only be Rhionda's slick leather boot. Crawling his way up beside her, he heard her moan and start to come to.

"Crap! What happened? Where are we?" she asked.

"We're, uh, quite literally worm food," remarked Buntleby dryly.

Dreelix's suddenly retreating form, Grindle lost his grip, rolled off, and bowled into the Monster Hunter's President. Dreelix was knocked to the ground and half buried under Grindle's massive form.

By this time, the worm had diverted its attention back to Lady Ablasta. Its mouth opened wide and the creature reared up, towering over the skinny woman. Lady Ablasta skittered backward, eyes glued to the gargantuan beast looming above her. Her dainty boot caught on a rock and she toppled onto her bottom. Before the worm could begin its descent, she hastily conjured up a web spell and flung it at the beast's head. Fortunately, it anchored itself between the cavern's ceiling and the top of the purple worm's head; the creature's head dangled in the air, suspended by numerous layers of thick, fibrous strands.

"Brilliant targeting," said Buntleby, as he and Rhionda rushed over to help the Conjurer Ablasta to her feet. "But it probably won't hold him for long."^a

"Not really all that brilliant, I'm afraid," replied the elderly woman. "I was aiming for his mouth, hoping to gum up those teeth of his."

Zantoulios took advantage of the worm's temporary immobility to pop off the last of his magic missile spells. "That's it for me," he said, trotting over to the others. "Can't tell whether we're hurting him much, though." Then, characteristically, he slipped in a glob of worm-slime and bonked the back of his head on the stone ground. He bolted back up to a sitting position with a puzzled expression on his face, looked around with a blank stare, muttered incoherently, then passed out on his back, bonking his head a second time for good measure.

Grindle trundled up, carrying an unconscious Dreelix under one arm. "Hit his head when he fell," he explained. "And I think I kinda squooshed him."

"We're getting our butts kicked!" remarked Rhionda with a snarl. "Anybody got any more spells?"

"I do," offered Buntleby, sending off a series of magic missiles that slammed into the thrashing worm's side.

Lady Ablasta rolled up her sleeves, exposing a selection of thin wands. She might have used up her spell inventory, but she was far from helpless. She selected her wand of magic missiles, recalled that it had gotten almost totally drained during their recent battle with a pyrohydra, and returned it to its sheath. Hmmm, let's see, she thought. Fear? Not likely. Ah, how about a couple of lightning bolts? Let's see what that stupid worm thinks about a bolt or two up his britches!

It was a nice thought, but one too late in coming. By the time Lady Ablasta had made her decision and slid the wand of lightning bolt from its sheath, the purple worm had pulled itself free from the web spell. It thrashed its body around, swinging its tail wildly. The edge of it slammed into the elderly conjurer's body, sending her flying one way and her wand sailing the other. She lay unmoving in a heap on the ground.

"Cripes, three down," muttered Rhionda, pulling a dagger from her boot. She looked at it for a second, then turned her gaze back at the worm, which was getting its bearings. The beast's pointed chin-spike aimed her way, and the creature began undulating in her direction, its toothed maw opening wide in anticipation.

"See to Zantoulios!" yelled Buntleby to Grindle as he rushed over to aid the Conjurer Ablasta yet again. Grindle grabbed the gangly wizard by the back of the collar and dragged him away from the approaching worm, as Buntleby scooped up Ablasta and headed that way himself. Rhionda, meanwhile, went straight for

10 Purple worms crawl in an undulating manner by expanding and contracting the bands of muscle that run the entire length of their bodies. While they have no legs, their armored skin is covered with numerous hairlike bristles, called setae, that act to grip the surface and pull them along.

11 A purple worm's primary attack is with its bite, which deals $2d8+12$ points of damage and allows it to initiate its improved grab. If the grapple attack is successful, the victim is pulled into the worm's mouth. At that point, bite damage is automatic until the victim escapes or is swallowed into the gizzard.

Swallowing a victim is accomplished by making a second successful grappling attack on any round following the initial successful grapple. If this second grapple attack is successful, the victim ends up in the worm's gizzard, where he or she takes $1d8$ points of acid damage plus an additional $2d8+12$ points of blunt damage each round. To climb out, the victim must make two successful grappling checks against the worm (one allows the victim to reach the maw, the second to exit the mouth). Unfortunately the purple worm has a +32 to grapple checks, dooming most attempts to escape in such a fashion.

12 Not that screaming at a purple worm does any good, as the creatures are stone deaf. They can detect vibrations, though, so the tromp of Buntleby's boots on the stone cavern floor can be "heard" by the worm much better than airborne sound waves.

Purple worms enjoy feasting upon shrieker fungus, but they are attracted by their scent, not the shrieks they make. Purple worms have a fairly good sense of smell; they often find their way back to their lairs by following the scent of their own mucus trails.

13 A cross-section of a purple worm shows five distinct layers. The outermost is the creature's mucus-coated skin, from which the beast's setae emerge. The next layer is a ring of muscle that circles each of the creature's numerous segments. The third layer is a series of long muscles running the length of the worm, connecting each ring-muscle in sequence. These long muscles allow the purple worm to crawl by expanding and contracting its body in sequence. The fourth layer is a hollow space called the coelom (pronounced SEE-lum, for those who care about such things), which is filled with fluid and acts as a buffer for the innermost layer, the digestive tract. The coelomic fluid allows the muscles of the digestive tract to keep about the business of pushing food along despite the movements of the rest of the body.

14 A victim inside a purple worm's gizzard can elect to carve its way out rather than climb back out through the mouth. This can only be accomplished with natural claws or a light piercing or slashing weapon. (This differs from the purple worm's description and is official errata. See this issue's "Sage Advice" for more details.) The gizzard of a purple worm is AC 20 and it takes 25 points of damage to carve a hole large enough to crawl out of. The hole is sealed up by muscular contraction shortly after being carved, so subsequent swallowed victims must cut their own exits.

15 Creatures swallowed by a purple worm are considered grappled and cannot cast spells with a somatic component, and any material components must already be in hand. Casting any spell requires a Concentration check ($DC = 20 + \text{spell level} + \text{damage dealt to the caster by the purple worm during the casting of the spell}$). Teleport has only a verbal component.

16 One of a purple worm's most useful senses is its tremorsense, which allows it to pinpoint the location of anything touching the ground within 60 feet of it. Of course, the best way to defeat a worm's tremorsense is to get off the ground, whether by flight magic, levitation, or something similar. If Willowquisp the Zoophile had been on hand for consultation, he'd probably have berated the Monster Hunters for not putting Dreelix's carpet of flying to its obvious use.

the advancing worm armed only with her dagger. The beast turned to face her. Seeing its response, Rhionda ran sideways, leading it further away from the others. She was confident that she could outdistance the worm for awhile, although she worried that she'd tire long before it would.

Buntleby dropped Lady Ablasta into Grindle's arms. "Here, look after them," he said, then turned to assist Rhionda against the worm. Grindle placed Lady Ablasta gently down upon the ground next to Dreelix and Zantoulios, all three out cold. He tried slapping

favorite maxims—when running out of options, go for the unpredictable—and charged the beast with her dagger.

Seeing this, Buntleby screamed in fright as he hobbled toward the beast on his one good foot. He cast his stinking cloud at the worm, hoping to at least distract it from Rhionda. But he needn't have worried; Rhionda, while often reckless, was no fool—as she came within touching distance of the worm, she bent her legs and jumped up for all she was worth.

With the aid of her boots of levitation, the jump took her straight up to

calculated the worm's distance: too close for his last fireball. Then he caught sight of the open portable hole, the water shimmering in the light of Zantoulios' staff.

"Into the water! Quick!" he yelled, turning to make a stand against the onrushing worm. "Quick!" he repeated, pushing Grindle into the water when he didn't move fast enough.

Dreelix and Zantoulios wasted no time diving into the hole; seeing Lady Ablasta hesitate at the indignity, Zantoulios grabbed her ankle with a bony hand and tugged her in as well. She sputtered and coughed when she surfaced, cursing Zantoulios in several languages none of the other Monster Hunters were aware she even knew.

By then, the worm was almost upon Buntleby, rearing up for a plunge-and-bite maneuver. The young wizard stood his ground, waiting until the last possible second before simultaneously falling backward into the "pool" and firing off the last of his fireballs. It went smack on target, past the rows of vicious teeth, down the creature's gullet, to strike somewhere inside the worm's digestive tract.

The explosion was incredible. Flames erupted throughout the worm's interior and shot out of its mouth like the dreaded breath of a red dragon. Buntleby missed the excitement, though, for while the flame shot over the Monster Hunters' heads he was spinning upside-down in the water-filled portable hole, doing his best not to get tangled up in the press of the other Monster Hunters' bodies. By the time he surfaced, the menace was over; the purple worm was dead.

"Hey, that was pretty impressive, Bunt!" said a familiar voice. Buntleby accepted Rhionda's proffered hand and pulled himself out of the water. Around him, the other Monster Hunters were doing likewise. Lady Ablasta, in sour humor, scowled at Zantoulios' offer of assistance and slapped his hand aside, crawling out of the portable hole on her own.

"What's that stink?" Rhionda asked suddenly.

"Us, no doubt," replied Buntleby. "We've been swimming in decaying-hydra washwater."

"No, it's not that. It's different," responded Rhionda.

"It wasn't me," remarked Grindle,

SHE CASUALLY FLICKED HER WRIST AND SENT HER DAGGER PLUNGING DEEPLY INTO ONE OF THE WORM'S BEADY BLACK EYES.

Dreelix awake, to no avail. Then, with sudden inspiration, he removed the portable hole from his pocket and spread it out upon the ground next to the unconscious wizards. Cupping his hands in the water-filled hole, he dribbled some onto Dreelix's face.

That seemed to do the trick. "Pshyagh!" complained Dreelix. "That stuff stinks!"

Buntleby, meanwhile, was in pursuit of the worm; he snatched up Zantoulios' glowing staff in passing, but slid in a patch of worm-slime as he did so and fell to the ground, twisting his ankle in the process. Holding his sore ankle in one hand, he spouted off the words to his last magic missile spell, enjoying the sight of the streaking bursts of energy slamming into the worm's thick hide. That left him with a stinking cloud of questionable usefulness and two fireball spells that he didn't dare use until Rhionda was out of harm's way.

Rhionda splashed into the underground pool up to her ankles, then turned to face the worm. She feared that the creature would prove more maneuverable in the water than she was, and she didn't wish to find out for sure.⁹² Instead, she applied one of her

the cavern ceiling. On the way up, she casually flicked her wrist and sent her dagger plunging deeply into one of the worm's beady black eyes.

"He's all yours, Bunt!" she cried from the safety of the ceiling, arms wrapped around a large stalactite for protection.

That was apparently true, for the purple worm, having lost track of its initial prey, turned to face Buntleby. The young wizard could see a stream of blood oozing its way down the creature's head from its wounded eye, but it didn't seem to faze the beast in the least.⁹³ As the worm snapped at him, Buntleby backed up, readying his first fireball spell but fearful of loosing it at this range. He hobbled back, the worm crawling after him. When he felt he was probably out of the range of effect, he cast the fireball, watching as it struck the creature in the head. "Got him!" Buntleby cried, excited at his success.

Then he noticed that the worm hadn't slowed its progress toward him, and he decided it was time to high-tail it again.

Grindle had succeeded at awakening the others with his "stinky water" trick when he saw Buntleby racing toward him with an awkward shamle-hop. "Get back!" Buntleby cried. "It's coming this way!" He peered over his shoulder and

looking over at Zantoulios. "I didn't do anything."

"Well, in any case, we got our worm!" enthused Dreelex, rubbing his hands together in glee. "It took some doing, but the Monster Hunters prevailed in the end!"

"And we were lucky at that," said Rhionda. "This was just a little one."²²

"Regardless," replied Dreelex, looking in scorn at the simple-minded fighter he had been forced to allow into his prestigious organization. "The fact remains: Not even a purple worm can survive the magical onslaught of the Monster Hunters!"

"Well, I suppose we'd better start harvesting it," said Buntleby. "What do we want? Teeth? Blood? Digestive juices? Grindle, do you still have that stinger tip?"

"Uhhh . . . good question," replied Dreelex, scratching his head. "I suppose we should probably bring all that stuff over to Old Gumphrey, see if he can do anything with it. But all I'm really interested in is the thing's head. You, Rhionda, you're a fighter; go make yourself useful and cut that thing's head off with that sword of yours, there's a good girl!"

"You want its whole head?" demanded Buntleby. "Whatever for?"

"You know that pompous windbag of a wizard, Quinquillian the Plane-Walker? He had the nerve to assert that the Monster Hunters wouldn't be able to handle a purple worm. Can you imagine? I told him that we certainly could too take down a purple worm, and he dared me to prove it. Dared! Me! I can't wait to see the look on his face when we show up and prove him wrong!"

"You mean—" began Buntleby.

"Tell me we didn't—" sputtered Zantoulios.

"I went through—" gasped the Conjurer Ablasta.

"Surely not even you—" started Rhionda.

Grindle, meanwhile, had pulled the small sack from his pocket and removed his soggy, frosting-covered pastry. He gave it a good squeeze to drain most of the water from it, then bit a good chunk of it off and chewed contentedly. "Huh?" he asked belatedly, mouth full, a puzzled expression on his face.

The other Monster Hunters ignored him and began arguing vehemently amongst themselves. Grindle shrugged his massive shoulders and returned his attention to the sticky pastry.

Finally Buntleby restored order. "All right, Dreelex, have it your way. Rhionda, go ahead and decapitate the worm if you can. Grindle, give her a hand, would you?" Grindle licked the last bit of frosting from his fingers and walked over to the dead worm.

"Oh, and Grindle?" asked Buntleby. "You still know the command words to Dreelex's carpet, don't you?" Grindle nodded, a puzzled expression on his face.

"Good," replied Buntleby. "You're piloting us home then. Rhionda, we'll let you ride on the tow line like you did on the way here."

"Great!" replied the young fighter, giving Buntleby a thumbs-up before slicing her sword deep into the worm's flesh.

"Wait a minute, what about me?" sputtered Dreelex.

"Oh, I haven't forgotten about you," replied Buntleby. "You'll get your worm's-head trophy all right, Dreelex—but you and it get the cheap seats on the way home!"

17 Like the common earthworm, a purple worm enjoys a limited type of regenerative ability: It can regrow a severed head or tail (or just the tail spike) in about a week, provided that the cut occurs either in the first five body segments or the last twelve body segments.

A purple worm with one severed end still attacks with its remaining end: a tailless worm still bites; a headless worm still strikes with its tail spike. (Although a headless worm loses its vision, its tremorsense is based on organs spaced evenly throughout its skin, and the creature's brain consists of a long nerve that runs the length of its body.) Obviously, although a headless worm still has a digestive tract, it cannot "bite" or "swallow" prey, nor can it burrow new passageways through the dirt or stone. Generally, a purple worm in this condition curls into a ball and conserves its energy, awaiting full restoration after a week or so.

18 With a 35 Strength, purple worms enjoy a +12 modifier to Strength-related die rolls, so *web* spells are, at best, a temporary measure against them.

19 Even though purple worms can "swim," they habitually crawl along the bottom of the ocean (or lake, or underground pool) floor, searching for food. This is because their tremorsense allows them to detect creatures scuttling across the ocean floor, but they have a hard time fixing the locations of fish swimming through the water. Ocean-dwelling purple worms—mottled worms, if you prefer the term—can oftentimes be found far out to sea, exploring coral reefs and deep oceanic trenches alike.

20 Purple worm blood is reddish, with a faint trace of purple to it. It is often used in the magical inks used to inscribe the arcane versions of *bull's strength*, *endurance*, and *mass strength*. (The latter spell is found on page 85 of *DRAGON* #275.) Purple worm blood is also often used in the creation of *manuals of bodily health*.

21 When seriously injured, purple worms exude a chemical that warns others of their kind away from the area for weeks. Many Underdark civilizations, knowing of this "warning scent," harvest the appropriate glands from immature purple worms and douse it around the entrances to their subterranean cities to keep purple worms at bay.

22 The standard purple worm is a Gargantuan beast, 5 feet in diameter and around 80 feet long, with a Hit Dice range of 16-32. While not as common, purple worms occasionally grow into the Colossal range, with 33-45 Hit Dice. These Colossal worms have up to a 10-foot diameter and can grow to be 150 feet long. A 40-HD Colossal purple worm bites for 4d6+16 points of damage, causes 2d8+8 points of damage with its tail spike, and the DC for its venom is 39 (10 + half the purple worm's Hit Dice + the purple worm's new Constitution modifier). A Colossal purple worm causes 4d6+16 points of crushing damage per round to creatures it has swallowed.

Purple Worm

“Day thirty of our expedition. We felt intermittent rumbling for several minutes, assumed it was an earthquake. Our duergar guides assured us the cavern was stable, and we pressed on. Then the ground burst open and the worm emerged, its teeth making a horrible grinding noise. Both of our pack lizards were in its direct path, and with two gulps they were gone. Then it ate one of our guides. The rest of us scattered, and I have become lost in a side passage...”

—the Journal of Eram la-Tep, found in a Darklands tunnel leading to Orv

Encased in segmented purple armor and with the ability to burrow through solid rock, a purple worm has few peers that can match it in sheer brute presence. Equipped with powerful jaws and a debilitating stinger, purple worms are well suited to battling many opponents at once, and use such opportunities to feed on as many foes as possible. Because it consumes vast quantities of rock as it burrows and processes the debris through its mighty gullet, a purple worm often leaves valuable treasures of unworked ores and gems in its wake—prizes for the taking by the careful scavenger.

OVERVIEW

Purple worms are truly masters of their territory, traveling through all three dimensions of their subterranean environment and its otherwise unyielding stone. With a full-grown specimen 80 feet in length, 5 feet in diameter, and weighing around 40,000 pounds, there are few opponents that can stand against one. Despite their great advantage in size and mobility, purple worms are driven by one overriding prerogative—feeding. That nature combined

with the purple worms' extremely low intelligence often allows the prepared individual who encounters one of the creatures to safely evade its predations as it pursues easier or more abundant prey.

ECOLOGY

Many sages speculate that the world is like an apple with a rotten core, where horrific creatures burrow through the planet's flesh, creating tunnels and vaults of prodigious size, and from which deep-spawned horrors occasionally emerge. Of these unknowable abominations thought to inhabit the world's deeps, the purple worm is considered to be but one of its smallest, yet farthest-wandering monstrosities. While the learned scholars have guessed rightly on some particulars of the kind of organisms and ecosystems that occupy Golarion's depths, they are actually incorrect in their understanding of the origins of the purple worms, for the great beasts originate not from the dark depths within the world but rather from the blackness *above* the world.

The purple worms hail from the deeps of the Dark Tapestry beyond Golarion's skies. They were first introduced to the planet in its primeval days when meteoric bombardments were a more commonplace occurrence, long before the memory of the sentient races. It is possible that this cosmic hail that carried with it these interstellar vermin originated from the destruction of the planets that formed the asteroid field known as the Diaspora, though what part such creatures may have played in those planets' fate is unguessed. *The Annals of Eox* makes mention of "star-worms" but little context is given other than apocryphal warnings and dire portents.

Regardless, in days long past, when the world was young and its landscape still shaped by the craters from celestial impacts, some of these rocky missiles served as cradles of life for resilient organisms hibernating inside and surviving the rigors of extra-atmospheric travel within stony cocoons. Many of the creatures were vaporized upon impact, but others were buried deep within rubble-strewn craters, knocked out of dormancy and exposed to a world rich in life-giving elements which allowed them to grow large and thrive. From these beginnings, the worm-like creatures burrowed deep, seeking sanctuary and spreading out to explore this new palate of abundance they had stumbled upon.

Purple worms survive on just about any organic material they can find, but such fare is often scarce in the subterranean realms they inhabit. As a result, they are able to leach minerals out of the rock they process through their gullets as they burrow. These not only provide the elements necessary for them to naturally produce their armor and poisonous stings but drive the great metabolisms and allow them to survive on sparse

provender. Though survive they do, a purple worm is never without the gnawing hunger of near starvation as it continues its eternal quest for sustenance. Due to this perpetual drive to hunt, purple worms seldom sleep, but when they do they typically enter hibernation, often for several years at a time.

Counting these periods of extended sleep, a purple worm can live for up to 800 years. They never stop growing, continually adding ring segments to their bodies. Undocumented older and larger specimens may also exist.

Purple worms are hermaphrodites and mate with other worms every decade or so, resulting in both individuals reproducing. Each worm lays a clutch of dozens of eggs within a mucus cocoon in a cavern and then collapses all entrances before abandoning it. Most of the eggs are destroyed through natural means or scavenging creatures, but 10 to 20 larval worms typically hatch. No more than a foot in diameter and 5 feet in length, these larvae turn on each other in a voracious feeding frenzy until only one or two are left; they then separate, as their ability to burrow through rock develops after about a week. During this time, the individual larval worms are relatively harmless to those who are prepared, but an entire swarm of them in feeding frenzy can prove to be a deadly encounter. Once the young develop the ability to burrow, they quickly begin to grow and reach maturity in only a handful of years.

Despite their penchant for burrowing, purple worms are also excellent swimmers, able to move swiftly through water and store air within their own coelum (the hollow cavity between their digestive tract and musculature), allowing them to modify their buoyancy and stay submerged for hours at a time.

HABITAT & SOCIETY

As is to be expected, purple worms spend the majority of their existences underground, either in subterranean cysts or burrowing through the earth and stone. Though they have no known vulnerability to its rays, purple worms typically avoid the sun, emerging into the open air of the surface only occasionally and for short periods of time. Some speculate that their lack of sight and reliance upon tremorsense cause them to sense the surface world as a great unknowable void from which they instinctively recoil. As a result, though traveling aboveground is no proof against attacks from a shallowly burrowing purple worm, if such an attack occurs, clambering up a nearby tree or freestanding structure can often dissuade them from pursuing prey. Underground, this tactic is far less likely to succeed, as the worm can potentially attack from any direction as it burrows through the surrounding strata.

CAMPAIGN ROLE

Purple worms are best used sparingly in a game, as they represent a sort of apex predator that lurks beyond the confines of most creatures' experiences. They are the distant rumbling that causes a vibration through the ground before fading away, the strangely rounded tunnel leading deeper into the bowels of the earth where none existed a day before, the furrow of sand flying into the air under tree-like discharges of static electricity, the sudden collapse of a cave wall scattering both sides of an overwhelming battle. In this role, purple worms and their assorted kin can be used as plot devices, foreshadowing, and even a *deus ex machina* if necessary to spare the party from an untimely destruction. Only after a group of PCs has worked up to sufficient power should they actually face a purple worm in combat, and even then, they should be used only as a rare occurrence until such time as the adventure leads them to epic-level quests into worm spawning grounds, across worm-infested deserts, and even to claim the treasures of the fabled Star-Worm from beyond history.

TREASURE

Purple worms do not collect treasure or intentionally hoard anything, but by their very natures they are frequently associated with valuable treasure finds. As a purple worm devours virtually any creature it meets, carried valuables that are able to survive the rigors of the beast's digestive tract are typically left behind—especially coins, weapons, or other durable metal goods. In addition, spelunkers often seek the former burrows of purple worms knowing that the casts they leave behind can contain rich deposits of unrefined ores that were isolated from the surrounding rock and deposited as leavings when a worm tunneled through. Finally,

actually butchering the carcass of a deceased purple worm can yield finds of unfinished gemstones lodged in its digestive tract. Among these are occasionally found smooth, hand-sized ovoids ranging from pearly-gray to jet-black in color. Called worm pearls, these stones are natural formations that occur within one of the worm's kidney-like organs from concretions of certain minerals and calcium crystals. They are valued as precious stones in some cultures, and in such settlements, a fist-sized stone typically fetches as much as 10–100 gp on the open market, with the largest and shiniest worth up to 250 gp. A typical purple worm may have as many as 2–5 worm pearls.

VARIANTS

The standard purple worm encountered by cave-delving adventurers is not the only such species in the larger family of gigantic burrowing worms.

Mottled Worm: Similar in many respects to the purple worm save for its brown and gray coloration, the mottled worm is an aquatic relative of the purple worm that dwells in salt or fresh water. Rather than conserve oxygen within their coelums as their violet cousins do, mottled worms are actually able to draw water into their coelums, where oxygen diffuses into their surrounding bloodstream via specialized gill-like organs. As a result, like fish, mottled worms can stay submerged indefinitely if the surrounding water is properly oxygenated. Since their coelums have enough stored fluid to allow their internal gills to function, mottled worms are also able to survive out of water for several hours, though the uncomfortable drying process makes them inclined to return to the water after about an hour on land.

Mottled worms cannot burrow through stone like their cousins, but are adept at moving through the muck and sand found on the seafloor and on tidal shelves (burrow speed 20 feet in mud, sand, or silt). Varieties exist that lurk both in shallow waters, preying on aquatic species, birds, and land animals, and in the deepest reaches of the sea where they build gigantic upright tubular formations created from their bodily waste. Such deep sea specimens are highly resistant to extremes in both temperature and pressure and, as a result, are often found near volcanic vents. Unlike purple worms, which are solitary, mottled worms of this deep-dwelling variety typically live in colonies of three to 12 individuals, and even the mighty krakens think twice before invading their hunting grounds.

Mottled worms have a poisonous bite rather than a poisonous sting.

Great Worm: Less common than purple worms or even their mottled worm cousins, these are found only in the most desolate regions. Thought by many to be mere legend, the great worms have been exposed to great magic, such as slowly digesting artifacts embedded in their gullets, consuming the foci of ley lines, interacting with magical portals, swallowing mighty demons, and so on. The worms gain powers appropriate to this magic and sometimes grow to unusual sizes, or gain near-human intelligence or stranger abilities; most also have extended lifespans, with some speculated to be over 1,500 years old. Those that grow in size have even greater appetites than their fellows, and their territory quickly becomes depleted of resources, turning into a wasteland as the creatures spiral outward in search of more to consume. Others hibernate for long periods before rising, famished and hunting anything they can find. These long periods of inactivity—sometimes spanning decades at a time or longer—have contributed to the near-legendary status of these worms.

A great worm has one or more of the following abilities, usually related to the source of its mutation. For every three of these abilities it has, increase its CR by +1.

SECRETS OF BURROWING

Purple worms are capable of burrowing through solid rock through a combination of brute strength and the particular chemical composition of their digestive system. The sheer force of their heavily armored heads fractures rocks upon impact, which are then engulfed in their vast tooth-lined maws. Their individual teeth have the strength and rigidity of hardened steel and are able to break rock and grind it into smaller particles as it passes down the worm's gullet. There it passes through the worm's streamlined digestive tract and is exposed to its multiple stomachs' acid designed specifically for quickly breaking down stone and many raw ores. It is then ejected in a constant spray of rocky casts that are expelled into the tunnel behind the worm. These casts are similar in appearance and composition to ordinary rubble and can often completely fill a tunnel through which a purple worm has just burrowed. In areas where the mineral content of the rock provides more of the minerals useable by a purple worm as nutrients, the quantity of this waste-slag is much less, and these burrow-paths aren't filled in, creating rounded tunnels 5 or more feet in diameter that meander in great curves and spirals. Long after worm activity in an area has ceased, smaller creatures frequently use their former burrows as convenient passageways.

While burrowing, purple worms generate a great deal of internal heat as a result of both excessive friction and chemical reactions within their lower digestive tracts. Creatures that have been swallowed by a purple worm and managed to escape alive have reported that they were not carried far enough down the digestive tract to receive injury from this internal heat generation (though the grinding action of the crop and deluge of stomach acids was certainly damaging enough) but were able to feel it radiating from lower in the creature's gullet, and observers have even detected a dim red glow when the creatures move quickly through the earth. How this heat contributes to the breakdown of earth and materials in the casts left behind is not fully understood, but it is assumed that there is a reaction similar to a slag forge. Byproducts of this process are visible heat distortions rising into the air from a purple worm's maw or even from the ground or a subterranean surface after the creature has been burrowing for any extended period of time.

Energy Attack: A great worm naturally exudes energy (usually the same type as its immunity or resistance, if any). Every 1d4 rounds, this energy builds up enough to deal 4d6 hit points damage to the first creature it hits that round with one of its natural attacks. Creatures it swallows take 1d6 energy damage per round in addition to other damage from the gullet. If the great worm burrows, the walls of the burrow-tunnel are charged with this energy, dealing 1d6 hit points of damage per round of contact for

4 rounds after the great worm passes. Alternatively, instead of a touch attack, the great worm may gain a breath weapon useable every 1d4 rounds (30-ft. cone, 8d6 damage, Reflex half DC 25); the save DC is Constitution-based.

Energy Healing: A great worm heals when exposed to energy to which it has immunity. Any energy attack of this type used against the worm heals 1 point of damage for every 3 points of damage it would otherwise deal. It cannot heal above its normal hit points in this way. The worm gets no saving throw against magical attacks that deal this kind of damage.

Energy Resistance: A great worm has energy resistance 20 to two kinds of energy or immunity to one kind of energy. Sometimes it may gain a weakness appropriate to the source of its power or the opposite of its element; a cold-resistant great worm might become vulnerable to fire, a fire worm might take damage from cold or exposure to water, and so on.

Fast healing: A great worm has fast healing 10. This ability cannot repair acid or fire damage. If the great worm is immune to fire or acid, it cannot repair damage from an energy source to which it is not immune.

Improved Tremorsense: A great worm's tremorsense expands to 120 feet or even 360 feet.

Quasi-Arcane: A great worm gains a *lesser displacement* effect (20% concealment) and SR 23.

Quasi-Elemental or Quasi-Undead: Suffused with the power of an elemental plane, an undead force, or some connection to the Negative Energy Plane, a great worm has a 25% chance to ignore extra damage from a critical hit, sneak attack, poison, paralysis, or stunning.

Variant Attack: A great worm's bite attack might inject poison equivalent to that in its stinger, or inflict its targets with a disease (typically *mummy rot*).

PURPLE WORMS ON GOLARION

Purple worms have inhabited Golarion since the earliest days of its prehistory when its surface was routinely bombarded by extraterrestrial debris. Carried among these falling stars were the first purple worms to reach the planet. Despite their long history on the world, their aversion to sunlight and lack of sufficient resources to sustain a large population keep incidences of their encounters with civilized races fairly rare. Without a doubt, purple worms are most frequently encountered in Golarion's Darklands, deep beneath the region's surface, and the races that dwell there are much more accustomed than uplanders to the ever-present danger that hungry purple worms represent.

Purple worms can be encountered virtually anywhere within the Darklands. They become more common the lower one descends, so much so that they are very rare in Nar-Voth yet hold the strange vault of the Black Desert as one of their great spawning grounds in Orv. Rumors

even hold that some specimens as large as the great desert worms of Casmaron actually delve even deeper than Orv, enjoying a near-immunity to heat and electromagnetic energies as they burrow to the very center of the world, growing fat and fecund in riddled tunnels unguessed at in Golarion's unknown, rotten core.

The Darklands neothelids are gifted with superior intelligence and powerful mental abilities; they look upon purple worms as idiot cousins good only for labor and guard work. Using their powers, neothelids crush the will of any purple worms that enter their territory, pressing them into service as excavation workers, steeds, or bodyguards for themselves and their seugathi minions. Sages suspect that purple worms and neothelids may be related in some way (much as hyenas and gnolls are said to be distantly related).

Far more insidious are the intellect devourers, evil predators that merge with a victim's brain, animating the body like a puppet, even something the size of a purple worm. Whether they do this to easily travel long distances, infiltrate neothelid communities, or experience gluttony on a massive scale, these creatures may be responsible for some encounters with "intelligent purple worms." (For more information on intellect devourers, neothelids, and seugathi, see *Pathfinder Chronicles: Into the Darklands*.)

The seas and shallows of Golarion are likewise home to the worms' mottled cousins, though on the continental shelves they are fewer in number than even the purple worms of the Darklands. However, in the deep trenches of the world's oceans where strange, lightless vents in the ocean floor expel poisonous gases from untold nether regions, the true numbers of the great columnar tubes that sprout from rocky flumes are known only to the deepest-diving and most foolhardy of aquatic races. Few who have witnessed the stone forests of the trench floors have lived to tell of it.

In Casmaron's central desert, tribesmen still whisper of a great crater in the depths of the wastes where water is scarce and the ground too stony for even the great worms. In this miles-wide valley, originally formed by the impact of a meteorite long ago, is said to dwell the first of the purple worms to arrive on Golarion from the Dark Tapestry. Superstitious whispers around campfires in the darkness of the desert nights tell of the primordial Star-Worm that birthed the great worms of the deep desert and that will someday arise from its slumber and consume the world. Numerous folktales of Namzaruum the Sword and other heroes of ancient lore tell of encounters with this horrific monstrosity from beyond, though none speak of its destruction, and many tell of some great-but-unnamed treasure said to lie with the slumbering Star-Worm—a treasure perhaps capable of somehow staving off the dire future its awakening portends.

PURPLE WORM

A toothed maw the size of a pony bursts forth from the earth in a shower of stones and flying debris. A vast, sinuous body rises behind it, covered in segmented plates of chitinous armor a deep violet in color. The reeking stench of death and sulfurous fumes are almost overwhelming, as is the sheer volume of the inarticulate roar that echoes forth from the beast's cavernous gullet. A wicked stinger marks the terminus of its prodigious length.

PURPLE WORM

CR 12

N Gargantuan magical beast

Init -2; Senses tremorsense 60 ft.; Listen +18, Spot -1

DEFENSE

AC 19, touch 4, flat-footed 19

(-2 Dex, +15 natural, -4 size)

hp 200 (16d10+112)

Fort +17, Ref +8, Will +4

OFFENSE

Spd 20 ft., burrow 20 ft., swim 10 ft.

Melee bite +25 (2d8+12) and

sting +20 (2d6+6 plus poison)

Space 20 ft.; Reach 15 ft.

Special Attacks improved grab, swallow whole, poison

TACTICS

During Combat A purple worm stalks its prey, emerging from the ground beneath in a charge attempting to grab and swallow. If forced into melee in the open, the worm coils and attacks anyone in reach with its bite and sting.

Morale Purple worms have extremely low intelligence and rarely retreat from battle. If reduced to hit points, a purple worm attempts to escape by burrowing into the nearest solid surface.

STATISTICS

Str 35, Dex 6, Con 25, Int 1, Wis 8, Cha 8

Base Atk +16; Grp +40

Feats Awesome Blow, Cleave, Improved Bull Rush, Power Attack, Weapon Focus (bite), Weapon Focus (sting)

Skills Listen +18, Swim +20

SPECIAL ABILITIES

Improved Grab (Ex) To use this ability, a purple worm must hit with its bite attack. It can then attempt to start a grapple as a free action without provoking an attack of opportunity. If it wins the grapple check, it establishes a hold and can attempt to swallow the foe the following round.

Poison (Ex) Injury, Fortitude DC 25, initial

damage 1d6 Str, secondary damage 2d6 Str. The save DC is Constitution-based.

Swallow Whole (Ex) A purple worm can try to swallow a grabbed opponent of a smaller size than itself by making a successful grapple check. Once inside, the opponent takes 2d8+12 points of crushing damage plus 8 points of acid damage per round from the worm's gizzard. A swallowed creature can cut its way out by using a light slashing or piercing weapon to deal 25 points of damage to the gizzard (AC 17). Once the creature exits, muscular action draws the armored segments of the worm together where chemical reactions with the creature's digestive enzymes cause them to fuse until natural healing occurs. Another swallowed opponent must cut its own way out. A gargantuan worm's interior can hold 2 Large, 8 Medium, 32 Small, 128 Tiny, or 512 Diminutive or smaller opponents.

Skills A purple worm has a +8 racial bonus on any Swim check to perform some special action or avoid a hazard. It can always choose to take 10 on a Swim check, even if distracted or endangered. It can use the run action while swimming, provided it swims in a straight line.

THE ECOLOGY OF THE RAKSHASA

Considered by some the very embodiment of evil, rakshasas dominate all they encounter as masterful manipulators, powerful sorcerers, and terrible foes. Greedy, treacherous, immortal beings, rakshasas delight in plotting the downfall of others while raising their own status, making them consummate arch-villains in a sufficiently high-level campaign. In addition to their own abilities, rakshasas are charismatic individuals who draw large numbers of minions into their service, surrounding themselves with cadres of deadly and varied servitors. Clever and deceitful by nature, rakshasas are the bane of righteous creatures, as they prefer hiding in the shadows and using layers of lies, corruption, and double-crosses to keep themselves safe.

This article examines the rakshasas' history, physiology, and psychology, as well as ways in which player characters can combat such deadly adversaries.

HISTORY OF THE RAKSHASA

A cloud of uncertainty conceals the rakshasas' origins. Numerous tales and legends say that they came from "a distant land,"

slowly corrupting the societies they encountered before moving on to richer grounds. Rakshasas possess all the earmarks of having the same lineage as devils, although they dwell primarily on the Material Plane. Even if they know their actual background, no rakshasa willingly parts with such information, and they often spin intricate webs of lies to further confuse the issue. The most popular theories include a race of fiendish animals somewhere in the rakshasas' distant past, intermingled with some unknown breed of devils. However, even this possibility seems unlikely considering rakshasas' uniquely insidious natures.

There exist countless documented cases of the rakshasas' sinister impact upon the world, even if some only suggest the fiends' claws manipulating major political players. Although vain and egotistical, rakshasas favor staying behind the scenes, pulling political strings with aplomb. They are linked to the toppling of untold organizations, merchant houses, churches, and even entire governments. Scholars who go through the effort of untangling the skeins of history discover rakshasas lurking behind some of the most deplorable crimes and tragedies imaginable. Those who delve too

deeply, however, risk drawing the attention of one or more rakshasas, who might briefly band together in order to quash an investigation before it uncovers too much.

PHYSIOLOGY OF RAKSHASAS

A rakshasa possesses the same size and build as an average human, but with the head of some savage animal, most commonly that of a Bengal tiger, although those of carnivorous apes, mantises, and crocodiles are only slightly less common. Rakshasas' eyes vary vastly, from the gold and black slits of tigers to the multifaceted protruding orbs of insects, depending on the individual's specific animalistic visage. Regardless of their shape, rakshasas' eyes burn with a slight infernal light, filled with a deep cunning and intellect that most mortals find extremely disturbing.

A rakshasa's hands is easily its most unnerving feature. The joints on both hands are reversed, causing the creature to bend its fingers to grasp objects in the opposite direction to how most humanoid hands grasp. The rakshasa suffers no difficulty doing this and grips things in the same way as other humanoids, although it enjoys horrifying others with this unnatural feature.

VARIANT BREEDS

Originating in the legends and lore of India, rakshasas initially appeared in D&D among the creatures of the first edition *Monster Manual*. Several recent products present new variations on these popular villains, each with deadly new abilities and sinister motivations all their own.

Rakshasas in Eberron

The *EBERRON Campaign Setting* unleashes a new rakshasa variant, known as the zakya. While still capable of casting spells, this breed of vicious fighters wades into hand-to-hand combat with relish. Zakyas once ruled the continents of Khorvaire and Sarolona, serving under powerful rajahs who commanded massive armies. Brought to heel by the combined might of the dragons of Argonneseen and the couatls of Xen'drik, the zakyas are a broken race, driven beneath the earth to plot and scheme. Their rulers, the Lords of Dust, fulfill many of the same roles as rakshasas in other settings—highly intelligent and vile schemers who use subterfuge, moral decay, and lies to further their plans. However, the zakyas are much more openly violent and bloodthirsty than their cousins and spoil for the chance to end lives on their blades and spears in combat.

Rakshasas in Monster Manual III

Monster Manual III introduces two new breeds of rakshasa, the ak'chazar and the naztharune. The ak'chazar seem most like the traditional rakshasa, deadly and manipulative schemers with powerful magical abilities and the heads of white tigers. Unlike their kin, however, ak'chazars hold dominion over the undead with a vast array of potent necromantic abilities and a cunning that even their fellow rakshasas begrudgingly respect. Besides these natural necromancers, *Monster Manual III* also presents the naztharune. These night-black rakshasas are master predators, applying their malicious racial ingenuity to the assassin's arts. With unnatural power over shadows, the naztharune strike from the darkness and vanish back into it without a trace. Along with their round-by-round tactics, *Monster Manual III* also provides suggestions for undead ak'chazar entourages, using naztharune as characters, and suggestions for both of these races' schemes in *EBERRON* and the *FORGOTTEN REALMS*.

Rakshasas prefer their food in the form of raw meat, preferably while the animal still lives, and flavor such meals with rare spices, exotic side dishes, and other expensive delicacies disgusting to the eyes of mortals. Many of their movements and behaviors straddle the line between that of a human and a large feline, as they enjoy long rests and prowling about unseen like a cat but also savor the finer things in life, such as music, works of art, and literature. They relish fancy, expensive clothing, jewelry, and the finest weapons and armor. Similar to cats, rakshasas enjoy long naps and lazy moments surrounded by comfort and luxury.

PSYCHOLOGY AND SOCIETY OF RAKSHASAS

Greedy than most devils, rakshasas insatiably desire wealth and power. However, more than just taking what they can, rakshasas prefer stealing and looting from those who would suffer most from such actions—the destitute, the desperate, and those who rely on specific items. Rakshasas take great pride in ruining the lives of mortals, stealing everything from them, killing their families, and spreading horrible lies and rumors.

When a rakshasa first enters a territory, it does its best to maintain a low profile, seeking out weak-willed individuals that it uses as pawns and lackeys. It finds a base to host its insidious dealings, often fronted by an innocuous business or even a temple to some neutral deity. Over time, however, the rakshasa tightens the reins on both his victims and his lackeys, demanding larger and larger portions of their freedom, wealth, and power.

Rakshasa society could be described as a malevolent meritocracy, where only the fittest survive. Rakshasas constantly rank each other based on the power they accumulate, their cunning and subtlety, and their willingness to show a complete lack of morals. Female rakshasas raise their young alone, punctuating their children's lives with dotting praise, constant tests, harsh discipline, and ruthless training. As a young rakshasa matures, it learns the meanings of both loss and power—that which is gained

RAVANNA

Lesser God (Lawful Evil)

Ravanna is the ten-headed lord of all rakshasas and embodies the ideals of that race. Decadent and egomaniacal, he possesses a cruel intellect, diabolical cunning, and patient subtlety that all of his minions aspire to.

Portfolio: Deception, intrigue, lies, rakshasas, tyranny

Domains: Destruction, Evil, Trickery

Favored Weapon: Javelin ("Yamafang")

Clerical Training: Few creatures willingly choose to serve Ravanna. Rather, the cunning god chooses his clerics based on their potential to serve him or advance his existing clergy's ambitions. Few who know of Ravanna refuse a summons into his service, as his fury is great and such commands commonly come from a group of powerful existing priests.

Quests: Ravanna demands that his servants constantly expand their power and influence while remaining unseen. This in effect makes his clergy more like a powerful and far-reaching criminal network than most priesthoods.

Prayers: Prayers to Ravanna are lengthy and self-deprecating affairs that extol his wonders while accentuating the unworthiness of his followers.

Temples: Ravanna demands few actual temples, but those that do exist tower as grand complexes made nearly entirely of precious materials and rife with terrible artistry. More common are the personal shrines Ravanna requires all his servants to maintain. These shrines are often ornate but portable affairs, both so his worshippers can conceal them at a moment's notice and transport them to their meal tables to commit his gory worship.

Rites: Ravanna demands daily sacrifices of both wealth and blood. Devotees of Ravanna make these sacrifices without any specific weapon or tool, but rather their own teeth and claws, regardless of race.

Herald and Allies: Ravanna's herald is a powerful rakshasa maharajah named Loliadac. With five heads—those of an ape, crocodile, mantis, tiger, and human—he commands an army of servants that travel Acheron, the Plane of Shadow, and the Material Plane at their god's command, acting as Ravanna's vengeful claw. Ravanna's allies and those he most commonly sends to fulfill *planar ally* spells are bone devils, hellcats, and of course rakshasas.

might easily be taken away, often by those who gave it in the first place.

Once a rakshasa reaches maturity, it's already well on its way to carving out an empire of crime and evil. Newly independent rakshasas commonly head out for unknown territories, far from its parents—or any other rakshasa's—reach. Using a variety of disguises, the rakshasa spends years investigating a new area. A rakshasa instinctively seeks out a safe house from which to operate, decorating its interior in ostentatious displays of its wealth. It then begins creating a network of spies, informants, and easily bribed officials from which to establish its domain, as well as creating a small cadre of loyal, easily influenced lackeys. The rakshasa then creates or takes over local thieves guilds, mercenary units, and other undesirables, often doing so under one disguise or another. It rarely reveals its true nature to anyone but utterly dedicated lieutenants whose loyalty the rakshasa constantly monitors both via spies and its own ability to read thoughts.

Should a rakshasa encounter another of its kind, a shadowy war of intrigue and misinformation often begins. This

battle of criminal politics culminates in one rakshasa dominating the other and subjugating its network or in the death of the weaker rival. As a rakshasa grows in power and dominates more and more of its kin, it takes on more and more prestigious titles, rising to *ruhk*, *rajah*, and all the way to maharajah after subjugating all other rakshasas in a region.

Notoriously cruel slavers, rakshasas collect slaves with the same relish they do exotic and rare art. A rakshasa surrounds itself with dozens of slaves who cater to its every whim. This serves to stroke the rakshasa's enormous ego as well as to show a level of status among others of its kind—the more slaves at its beck and call, the more powerful the rakshasa.

Using its detect thoughts ability, as well as information provided by spies and informants, a rakshasa searches out every weakness, sin, and secret about its enemies as possible. It then uses bribes and offers of power to attempt to bring its target into its web. If this fails, the rakshasa extorts, blackmails, or slanders its target to bring about his destruction. It loves nothing more than to see an otherwise good and upstanding citizen

brought down by others of its kind due to some dark secret.

Rakshasas are natural spellcasters with a deep lust for the acquisition of arcane lore and magic items. They spend a great deal of time researching lost tomes and following up bits of rumors and legend to find powerful spells, especially those of an evil nature. Rakshasas sometimes sponsor adventuring groups to delve into forgotten tombs and forbidding lands in the quest for such items, often portraying themselves as kindly patrons of arcane organizations or ambitious merchants.

VERSUS THE RAKSHASA

Although they rarely engage in physical battle, rakshasas are powerful and deadly opponents. Once adventurers tear away the myriad veils of magic and lies a rakshasa hides behind, only preparation and skill will assure survival against one of these evil masterminds.

Beware of Deception: The most difficult part of fighting a rakshasa is realizing that you are opposing one in the first place. Rakshasas excel at deception, lies, and deceit. They use their change shape ability to keep opponents guessing, while also adopting a range of favorite particular disguises. Adventurers hoping to ferret out a shape-changing rakshasa should make frequent use of divination spells like *detect evil*, *detect thoughts*, and especially *true seeing*.

Turn Enemies into Allies: The hordes of lackeys and bodyguards rakshasas employ often present just as great a threat as rakshasas themselves. Because they can read the thought of others, rakshasas allow only the most loyal beings to get close to them. As such, characters attempting to shift the loyalty of a rakshasa's lieutenants through trickery or charm almost always fail. However, enchantment spells such as *charm monster*, *charm person*, and *geas/quest* prove far more successful. Magically turning a rakshasa's allies against it weakens its defenses while bolstering those of the characters.

RAKSHASA KNOWLEDGE

The following table shows the results of a Knowledge (the planes) check as it relates to the rakshasa. Those who hunt these beings or work under their control might possess this information.

Knowledge (The Planes)

DC	Result
10	Rakshasas are hideously evil, animal-headed creatures whose malevolence is on par with most devils.
15	Rakshasas can take the form of almost any humanoid and use this ability to hide among unsuspecting groups in order to sow lies and corruption. They bully or bribe weak-willed individuals to do their bidding.
20	Rakshasas have the ability to read the thoughts of others, which allows them to discover a person's deepest fears and desires. They are resistant to most forms of attacks.
25	Rakshasas are extremely fractious beings that spend as much time fighting among themselves as they do plotting against other creatures.
30	Rakshasas are vulnerable to good-aligned piercing weapons, such as crossbow bolts benefiting from the spell <i>bless weapon</i> .

Guard Your Thoughts: A rakshasa's detect thoughts ability is often its most useful tool and weapon. Its constant awareness of the presence of thinking minds within the area forces its enemies to use spells such as *mind blank* (or, less powerfully, *nondetection*) and magic items such as *amulets of proof against detection and location*. As its detect thoughts ability requires at least three rounds of concentration for the rakshasa to read the surface thoughts of a creature, it does its best to stay within range for at least that long to reveal a person's intentions (but only if it is safe to do so). Those hunting rakshasas should remain mindful of the ability's 60-foot cone-shaped area. As a rakshasa must focus this ability in a specific area each round, a stealthy group of adventurers might keep their opponent's attention diverted long enough to get close enough to attack. As this ability also requires concentration to maintain, a rakshasa involved in combat often forgoes this ability in order to cast spells or attack. As fitting such an intelligent creature, a rakshasa often employs hit and run tactics, pulling back to someplace safe in order to read the thoughts of its enemies and change its tactics accordingly.

Destroy Magical Defenses: Rather cowardly by nature, rakshasas commonly cast spells that bolster themselves, such as *bear's endurance* and *haste*, or improves their defensive

abilities, such as *mage armor*. Rakshasas also make judicious use of *charm person* or *suggestion* to change the attitude of anyone with ill intentions toward them. They reserve their offensive spells, such as *Melf's acid arrow*, as a last resort. Rakshasas that take character levels almost always take several levels in sorcerer. Spells like *dispel magic* are necessary to negate a rakshasa's defensive magic and perform counterspells, while several castings of *protection from evil* should defend an entire party against enchantment spells.

Beware of Resistances: Spellcasters should remember that rakshasas possess impressive spell resistance, which foils many magical attacks against them. Also, the rakshasa's damage reduction (15 good and piercing) seriously reduces any damage not dealt by a weapon that is both piercing and good aligned. A rakshasa uses these facts to its advantage, often attacking spellcasters first (who must overcome its spell resistance and are unlikely to deal physical damage that gets past the rakshasa's DR). Blessed bows and crossbows prove the most effective weapons when employed against rakshasas, allowing the attacker to fire from a safe distance while negating the rakshasa's formidable damage reduction. The spell *bless weapon* is also integral, as it gives any weapon the good quality, although it must be cast on a piercing weapon to totally overcome a rakshasa's damage reduction. ■

The ecology of the Remorhaz

by Kurt Martin
and Ed Greenwood

An account from the lore-book entitled "Journeys and Trials of Rekansor; Explorer, Scout, and Leader of Men":

... Thus began the hardest segment of the journey back to our civilized lands in

the east. Our clothing was barely adequate against the increasing chill, and we were reduced painfully in both numbers and supplies. Each day the true test of winter drew nearer, and even as we first began to struggle up the steep escarpments that announced the Krylen Peaks, the cold of their icy reaches stretched down to greet us with bitter blasts. The twelve of us yet

remaining trudged on, weary to the soul of adventure, desiring only the end of the road and safety.

Arriving at the foot of Al-Kindor, the westernmost and mightiest of these mountains, I found a possible route for my group. Pressed by Time himself, we began to follow this sketchy path that picked its way through the fallen boulders at the mountain's base.

This way seemed to lead as we hoped: around the mountain on its southernmost side. With Al-Kindor at our backs, we could traverse the range at this narrow point in as little as two days. We pushed onward, climbing between the jumbled rocks in an endless, stumbling dance. Only the quick passing of this obstacle, this king of mountains, would put us within reach of the plains of home before all hope ended with the coming of winter. Each of us knew secretly that we would not survive even one true snowfall.

Curious as ever, I wondered at the improving sureness of the path as it wandered neatly among the rocks. With the first fluffy pockets of snow collecting under a new fall, the path remained solid and clear, yet no tracks were visible in the old snow to reveal the users of such a fine mountain course. The snow stiffened its assault, clutching at sword and arrow as well as hunched shoulders and hooded heads.

Above us loomed Al-Kindor, half shrouded in cloud. His jagged peaks tore at the clouds, ripping the snow from them. Already the upper reaches were turning distinctly white. The sky hung over us, a dismal grey, like the snow-dusted stone our boots scuffed over. For a moment, the sun poked a crimson ray out over the frozen tundra as it sank at our backs, setting the falling flakes on fire, turning white puffs into red drops of blood. I shivered at this grim omen.

We pushed on, intent on covering more ground before nightfall, hastily shuffling past a dark gap in the rocks — an aperture our inner selves warned us to avoid. Little did we know, it was a door where the remorhaz, the owner of the path, lay in terrible wait. Cunningly, the creature paused at our arrival, waiting for its body to warm from the stillness of its hunting vigil; waiting until all but the last of our party had struggled past before attacking with a birdlike shriek that chilled my blood more than the previous hours of frost had.

I turned to see a huge creature, looking much like a massive centipede, snapping at my men with enormous, fanged jaws. Its white, icy eyes glared down on us as the small, membranous wings on the sides of its head flapped to lift its jaws high for another strike. The remorhaz's thick neck arched, and the long, curving black horns on its head were silhouetted against the grim sky as it screamed another challenge. Now I saw clearly the folly of following such an easy path.

The beast's heavily scaled body was a man's height across and gleamed a cold blue, stretching away for several long strides before winding into the gap in the rocks. Along its back, a wide streak of bright red stood out, steaming from the creature's heat. Dozens of short, chitinous legs supported the low-slung bulk as it again snapped forward, its hard talons clattering on the stone.

Three of my party already lay silent in the gathering snow, torn by the beast's four horrible fangs. As my comrades threw back their hoods and heavy cloaks, snatching at weapons and shields, I quickly drew my bow and an arrow, and bounded to a rock at the path's edge. Pulling myself onto the frigid stone, I readied for a shot as Benol, my finest scout, dropped to the snow, her body hewn almost in two by a strike from the monster's jaws. Even as she fell, and my first arrow glanced harmlessly off the beast's armorlike skin, my group started forming a battle line, their weapons seeking the creature's weaker points.

Kelor thrust himself directly in front of the creature, his wide bastard sword glowing dully in the fading light. The remorhaz screeched as if in answer to his challenge and drew its head up to twice the height of a man. Kelor jumped forward, his sword swung back, ready for a massive blow. Then, despite the impact of two arrows, the beast shot forward blindingly fast, and Kelor disappeared into the snapping jaws. His sword, clattering noisily on the rocks, was the only evidence of where he had once stood.

We fought on instead of trying to flee; doubtless the creature could outrun us, tired as we were. Thoughts cluttered my mind as I searched desperately for a shard of hope. I could see Farvus, alone off to my left, hard at work with his spell magic. I whispered a silent prayer for his success as I returned to my bow-work; my red-feathered arrows were beginning to accumulate in the creature's soft underbelly. In spite of these wounds, and several rents from swords, the remorhaz seemed prepared to fight us to the last.

From amidst the rocks into which the long creature's body coiled, I saw the small, florentine form of Kartha emerge, his eyes intent on the monster's swinging head. I watched him, distracted from my attack, as he slunk alongside the kicking legs, staying clear of the red streak on the creature's back where the falling snow sizzled and steamed.

Kartha moved closer, perilously close to the thrusting, coiling neck, before pausing to stretch, raising his weapons high in the air. He plunged them into the steaming protrusions with an angry shout. The remorhaz heaved forward with a shriek of pain, throwing the overextended Kartha off balance. He glanced off the beast's back, let out a shrill scream, and fell limply to the snow. Curls of smoke rose from his still form. I paused in shock as

the remorhaz snapped out again, oblivious to the knife and sword as they melted, then dripped into the snow.

Glancing frantically back to see what Farvus was doing, I was further shocked to see his obvious frustration. Already he had turned to shield and mace and was advancing toward the creature, which was now faced with only five standing opponents. I dropped from the rock and drew my sword to strike the remorhaz face to face. It was terrifying work. In a few short moments, my vision began to blur from the effort of slashing at the monster and desperately trying to avoid its fatal bite. I slipped and lunged in the damp snow, my tired legs heavy as logs. I managed to cut the thing twice, though my sword was heavy even in both hands. Its wings flapping, the beast snapped at me, its breath overpowering, its cries daunting.

Helt screamed as a fang tore into her. The remorhaz tossed her aside in a heap. But in the moment it took to do so, Farvus and I attacked with desperate strength, hitting the exposed neck, my sword biting deep into the softer underside of the monster's head.

Hacked and hewn, the snapping head finally dropped into the snow. Only three of us remained to see the creature's final moments — and we took no great pleasure in its demise. As we stood about the remorhaz for a long, silent minute, the cruel wind tore at our skin. Despair was in our hearts; the battle was won, but at too great a cost. Puffs of snow stood on the faces of our fallen friends. Distant were their homes and ours. Anguished, it struck me as likely that we would travel no great distance beyond that point — not with the bulk of the company silenced forever around us. Slowly we turned from the scene of battle, and looked again to the east. . . .

Notes

1. A remorhaz has a segmented body, like other worms, plus a winged neck and head. Each segment (a polar worm will have one such segment per hit die it possesses) consists of a central "core," or body cavity, where the digestive organs are located, surrounded by a network of terrifically strong muscles linked by corded nerves, and the whole sheathed by the worm's rock-hard external insulation and armor. Each segment is supported by a pair of flexible legs covered in similar segmented armor, each leg ending in a foot consisting of a large suction pad (devoid of nerves, so that a remorhaz cannot feel pain through its feet) and two iron-hard "toe-talons." These talons serve to propel the remorhaz across the most slippery ice — the "blue ice" at the heart of glaciers where the creatures prefer to lair. In conditions where a remorhaz's feet begin to slip, it will automatically drive its talons into the surface underfoot. It cannot penetrate hard rock, but can readily

find and cling to fissures and cracks in rock, or penetrate softer rocks (such as sandstone), ice, frozen mud, and the like. Fallen prey and items so impaled by a talon will suffer damage as follows: Creatures suffer 4-9 (1d6 + 3) hit points of damage, and all items (such as armor) must save versus crushing blow or be damaged beyond usability. Magic items will of course gain bonuses to any such saving throws in accordance with their magical plusses; but note that all sorts of items may suffer penalties on saving throws due to the brittleness that extreme cold causes in many materials.

A remorhaz does not gain or lose heat through its feet or body armor unless the body armor has been broken (before an insulating scab of internal protective fluids forms), except through its back protrusions. Given steady food, a remorhaz will regenerate a completely lost pair of legs in twenty days or so; lesser damage could well be healed in half the time. A remorhaz can slither at half movement rate — but not climb bare ice walls — if all of its legs are gone; if more than half of its legs are gone, it will move at 9" per round. Liquid mud or deep sand (which will not be encountered by a remorhaz in its normal habitat) will slow movement to 6"; unfrozen water is avoided by a remorhaz in the polar regions as it cools the worm's body with dangerous rapidity. A remorhaz can swim at the rate of 9" per round.

2. The wings of a remorhaz aid in stability while rearing and lunging (and rarely, while slipping or falling), and in regulating body heat (see notes below), but cannot lift the entire body of the worm; a remorhaz cannot fly. The remorhaz can only raise its head and neck with the aid of these wings. The wings must beat continuously in order to do this and are highly susceptible to attack. The attacker must hit versus AC -2 to strike them, since they are small, fast-moving, and often out of reach. Area fire spells such as *fireball* will also affect the wings, with each wing taking as many points of damage as the creature has hit dice before becoming useless. The loss of one or both wings will cause the remorhaz to attack at -3 to hit, since it will no longer be able to rear up and snap at its opponent. The remorhaz will, however, still be able to move and maneuver, and this state will inadvertently prevent attacks to its soft underside.

Damage done by the remorhaz's four fangs and sharp-edged jaws is determined by the size of the creature, with 13 and 14 HD specimens having the ability to swallow man-sized or smaller prey whole on a roll of 20. However, halflings and other small demi-humans, and creatures of similar size may be swallowed in this manner by a remorhaz as small as 11 HD; elves and small humans can likewise be swallowed whole by a 12 HD remorhaz. On any roll of 20, check the size of the

remorhaz to see if it is capable of swallowing the creature it has bitten. Even if the target is not swallowed, it takes full bite damage from that attack.

A remorhaz of 7 or 8 HD bites for 4-24 points of damage; 9 to 12 HD creatures do 5-30 points; and 13 to 14 HD creatures do 6-36 points. When raised up to strike, a remorhaz is 9 inches tall for every hit die it has. Thus, a 14 HD remorhaz would be 10 feet, 6 inches tall at the head and could attack a character standing on a second-story balcony. The remorhaz can strike out an equal distance horizontally.

3. The area of the remorhaz most vulnerable to physical attack is its eyes, which are actually two great, white, globular clusters of lenses, all working together, and all milky-white because they have natural filters to correct for snow glare. These natural filters allow the remorhaz to see reflections and movements with great clarity — and in gloom or at night with 9" ultravision (in full darkness, or when confused, a remorhaz uses the 7" infravision of its tiny eyes). Each compound eye has more than a thousand tiny eyes within it — thus, an attack to the eyes is not likely to blind a remorhaz; up to a dozen or more strikes on each eye would be necessary to accomplish that. A remorhaz regenerates its eyes only slowly (each tiny eye would take about 30 turns to heal, and only one at a time will be replaced by the worm's body).

Because of these insectlike eyes, remorhaz (the plural form is the same as the singular) have excellent peripheral vision. In combat, they are equally likely to strike at any creature in an arc of 180 degrees in front of them, with preference given to those striking the most recent, most damaging blows against it. The target of the remorhaz's attack will be at -2 to hit for the round after their attack, due to the overpowering stench of the creature's superheated breath (normal if they make their save vs. breath weapon). Remorhaz do not deliberately claw or trample prey, nor do they ever strike at them with their "tails" or nether body segments. In combat, they may "pin" opponents with their weight and bite at them, but prefer to rear up (aided by their wings) and lunge at all prey, biting with speed enough to knock down many aerial opponents, and with reach enough to strike from a rearing position at opponents up to half the remorhaz's own length away (on the ground or in the air).

The majority of the remorhaz's body is heavily insulated with armor that renders it proof against any harm from scraping against or over ice. The most flexible parts of the armor (and hence, the softest) are the underside regions of each segment, which must have softness and flexibility to aid traction over uneven ice — hence, the lower armor class. The intermediate armor class rating of a remorhaz reflects the relative vulnerability of its mouth and

eyes, despite the mobility of the head as a target. Man-sized opponents of a remorhaz will find that while the creature's underside is softer than the rest of its body, only two attackers can strike at this area, with one standing on each side of the raised head. Other opponents standing directly in front of the remorhaz (two at most) can strike at the AC 2 head. All other attacks are versus AC 0.

4. Remorhaz have three life states: dormant, cold, and heated. Since remorhaz can "burn up" the energy provided by a large meal (such as two horses) in just a few hours of tunneling, moving, or fighting, they spend much of their time in either a dormant or cold state — dormant being a very sluggish, economical condition, and cold being active without heating the back protrusions. Remorhaz are always eager to eat, since they are active in proportion to how much they consume. Because of their metabolism, polar worms make ambush their primary hunting mode, and only occasionally travel in search of prey. A remorhaz will lay in wait along a well-travelled road in a "cold" state. When prey is sighted, the remorhaz heats its back protrusions, then attacks. Remorhaz lie dormant through periods when prey is scarce, spending at least one day in five dormant in any case. Dormant periods are always spent in the lair.

When excited (by easy prey when it is hungry) or angered by prey that eludes it, seems formidable, challenges it, or causes it pain, a remorhaz will cause its back protrusions — the blunt "horns" or projections, two of which rise at angles from the ridged top or back of each of its body segments and form two rows of craggy bumps — to become extremely hot, conducting the worm's internal digestive heat by means of internally produced and circulated fluids. This chemical, which is known as thrym, is released from its two stomachs, and pumped at great pressure into its insulated back horns. A remorhaz will then lunge at opponents and roll slightly to one side, seeking to crush or pin, and then burn with its horns. Contact with the cherry-red remorhaz horns does 10d10 points of damage to all creatures not impervious to (or protected against) heat damage; cooler, darker horns do only 5d10 points of damage. (A roll of 1-2 on 1d6 determines a hit with the darker, cooler horns.) Protection is provided by any item such as a *ring of fire resistance* — not just a normal item, such as armor or a pair of gloves, Damage to protected areas will still occur, though at a rate of 1/10 regular damage: 1d10 points for regular horns, 1d5 points for cooler horns. Non-magical metal weapons melt when touching cherry-red remorhaz horns; they gain a saving throw (vs. magical fire) against cooler horns. Magical metal weapons gain a saving throw vs. acid (with their magical bonuses, if any) against cherry-red remorhaz horns, and a saving throw vs.

magical fire at + 5 (disregard magical bonuses) against the cooler horns; other magic items save vs. acid or magical fire — whichever is worse — against cherry-red remorhaz horns, and must make a saving throw of only half as much to escape damage from the cooler horns. Most creatures will feel the heat when they are within ten feet of the protrusions; these may also steam when wet. The remorhaz will usually heat its back to aid in tunneling through ice and snow, and will always do so in battle.

A remorhaz heats up its back in bursts of energy, for in doing so it is sacrificing its body heat to its chilly surroundings — and could freeze to death if it gives up too much heat. Normally, a remorhaz that decides to heat warms up for 2 rounds (during which time it has cooler horns, as above), fights for up to 6 additional rounds of cherry-red heat (less if it wins its fight, for it will shut down as soon as possible), and then follows with a further 2 rounds of cooling. A remorhaz of 10 HD or less can usually manage only one such burst every 36 hours (unless it can eat at will to provide more fuel; a nesting female remorhaz surrounded by already slain meals at hand is one example); a remorhaz of 11 to 14 HD can usually manage 10 rounds of full heat, typically in two bursts of 6 and 4 rounds each. If the air is damp, concealing plumes of fog will begin to form around the remorhaz as the cold air comes into contact with its back horns. The average remorhaz must take in one size M meal (of warm-blooded prey) every 36 hours to keep its heat at the required level, otherwise it risks the chance of freezing to death.

If a remorhaz gets too hot (usually only when removed from its normal environment), its surroundings reaching 60 degrees Fahrenheit or more, it will begin to fan itself with its wings, passing air over its back horns to carry the heat they radiate away. The remorhaz will grow sluggish (operating at half movement), but will not otherwise suffer harm from the excess heat. When it becomes cool again, the remorhaz will recover rapidly (in 1 or 2 rounds) to full movement and activity.

5. As a snakelike carnivore, the remorhaz requires special digestive processes to aid in breaking down the huge hunks of meat it swallows. Two tiny stomach glands produce and contain fluids that mix to make the liquid called thrym, which is then circulated through the creature's back protrusions and/or stomach. Digestion is achieved with both the heat and acidity of thrym. Since the liquid is extremely hot and caustic, there have been no known cases of even swallowed magical items surviving immersion in thrym, although it might be possible for artifacts and relics to do so. Molten metals and other indigestible materials are immediately excreted through a flap at the bottom of the beast's stomach. Wood and

leather are easily dissolved, if not useful to the remorhaz itself.

Obviously, anyone unfortunate enough to be swallowed by a remorhaz would be killed instantly by the tremendous heat of the creature's body. Even major protection such as a *ring of fire resistance* would only allow a person to survive 1 or 2 rounds inside a remorhaz. DMs must be firm on this count, since killing the creature in the round after it swallows someone, then cutting the creature open to rescue the victim would still require that person to withstand at least 2 rounds of the phenomenal, acidic heat.

The remorhaz's thym is the reason for its high magic resistance. This substance has a high anti-magic value, whether actually heating the creature or not; thus, the remorhaz's magic resistance remains the same regardless of the creature's state until it dies (see below). Note that all spells cast at a remorhaz must overcome this 75% magic resistance, then the remorhaz's saving throws (if applicable); fire is saved against at +4, heat does no damage (being either absorbed to the benefit of the remorhaz, or lost), cold is saved against at -3, and electrical-based attacks are saved against at par.

6. A polar worm's lair will usually consist of a number of large, smoothly rounded tunnels in ice and snow or rock, gradually descending to a bigger, central room. Tunnels in ice or snow will be very slippery, since the passing of the creature's hot back will repeatedly melt the snow, but leave it to quickly refreeze. With its numerous hard feet, the remorhaz moves at full speed on sheer ice (if it is a level surface) and has no problems in its own lair and tunnel complex. Remorhaz usually move with their heads down, their wings inactive, looking something like a walking snake. As a result of this position, remorhaz cannot snap out with their usual dexterity, and are thus somewhat vulnerable in small tunnels.

The central room of the remorhaz lair is generally about twice the width and length of the remorhaz that inhabits it, and has several entrances and exits. The nesting lair of a mated pair will be about double this size, and may have ice stalactites hanging from the ceiling as a result.

Remorhaz have no use for treasure as we know it; any treasure found will consist of belongings left behind by devoured prey — either scattered about the icy wastes or on the floor of the remorhaz's lair. Such treasure rarely consists of arms or armor, since these are usually destroyed or lost in combat, and will never be anything that cannot survive the extreme cold or inadvertent pummeling by the remorhaz. A remorhaz will take prey into its lair only when it is threatened by a storm or by other predators, if its meal is threatened by other, smaller predators too nimble or too numerous for the polar worm to slay, or if it is a male feeding a

nesting female or a female hunting with its young.

7. Remorhaz mate only in glacial tunnels and icy caverns, although they range all over cold regions when hunting, often wandering far from their lairs; if they remained in a small area, food there would soon be exhausted. If food is scarce, remorhaz sometimes come down off the high glaciers into the tundra or even to the edge of muskeg regions to hunt. With the exception of mates, and mothers and their young, remorhaz hunt and lair alone; when food is plentiful, remorhaz of different sexes will instinctively wander out of their own normal ranges (each remorhaz has an informal, shifting circular territory of approximately 60 miles across) and seek one another out, establishing a nesting lair after they meet. They signal their presence at such rutting times by great, mournful roars, sounding at times like great wolves, and repeatedly rear up and flap their vestigial wings to attract notice. Remorhaz seldom fight among themselves over territory, mates, or prey.

Remorhaz females are generally larger than males (there are no 14 HD males), but they are otherwise identical in powers and appearance. A mated pair will stay together only until the eggs have hatched. During this time, the female will produce one or two grey-blue eggs 60 to 90 days after a nesting lair is created. Mating season for the remorhaz takes place in the fall of the coming year, with all pairs separating before that time. Any adult remorhaz has a 25% chance of having a mate during this season.

Remorhaz eggs must be kept warm (60 degrees Fahrenheit or more) or they will not hatch; any egg that is allowed to cool to the surrounding, freezing temperatures and remain that cold for more than a turn will never hatch a living young. For this reason, the female remorhaz coils about the eggs to keep them warm until they hatch (three or four months later). During this gestation period, the developing young change from helpless, soft worms to miniature remorhaz, and eat their way around the thick nutrient walls of their own eggs to freedom. The young stay in the nesting lair for approximately four months after hatching, growing in this time from 1 HD at birth to 7 HD at the end of that period. Immature remorhaz will only fight to defend themselves, biting for 2d6 points of damage, fighting as 2 HD less and attacking last in a round. The young seldom leave the lair, and will be size S at hatching, M at 2-3 HD, and L from 4 HD on. From birth, the newborn remorhaz has all the powers of the adult.

Shortly after their birth, young remorhaz are driven forth from the lair by the mother to fend for themselves, accompanying her for only a half-dozen or so daily hunts before being driven off. An adult male will leave his mate as soon as the young are born — but if the eggs fail

to hatch (25% are infertile) or are damaged, destroyed, or go missing (due to predators, shifting glacial ice, and so on), he will remain patiently through one egg-laying after another until one or two live young are born. Polar worm eggs are valuable because the remorhaz make excellent guards. However, even those raised from the egg can never recognize more than one or two masters, and will attack anyone if they are hungry enough.

8. The fascinating body of the remorhaz will always reveal many useful items to the industrious. The largest specimens will yield two curving black horns the length of a man's body. These are easily hollowed out and have thus become scimitar scabbards and even unusual drinking mugs. The four sharp fangs make excellent daggers and knives, being almost a foot in length. The 28 legs are tubular in shape and very hard. They have been made into everything from canes and cups to blowguns, usually after they have been boiled to cook the succulent meat inside (a very rare delicacy indeed). The tough under-skin of the beast makes excellent leather, while the scaly sections of the body make for good bucklers (they are not big enough for full-sized shields). The vestigial wings of the remorhaz are useful mostly for ornamentation, but become brittle and will eventually crumble if not immediately preserved.

In the largest remorhaz, the special stomach glands hold as much as a quart of the liquids that compose thym. Unfortunately, few have succeeded in removing this substance from the creature without it losing its value. Though thym requires the remorhaz's particular physiology to maintain its power, a mixture of the two chemicals after the creature's death will create a weak acidic reaction (as illustrated in the *DMG*, p. 64) — a potency that lasts for up to one day following the remorhaz's death. After this point, the individual liquids have a minor value to alchemists, who use the circulatory fluids as ingredients in the spell inks of all magics concerned with heat (*produce flame*, *heat metal*, *burning hands*, and so on), and in magics concerned with neutralizing poisons — for the fluids seem to confer upon the living remorhaz an immunity to poison. This fluid is also useful in the manufacture of potions, such as *potions of fire resistance*, and in the making of items such as *rings of fire resistance* and *rings of warmth*. Prices vary according to the scarcity of worms and differing strengths of the desires of alchemists, but are typically 5-10 gp per flask of each remorhaz fluid.

The cell retinæ and internal fluid of the remorhaz's compound eyes are useful in the creation of *eyes of the eagle*, and in the making of special inks used to set down such spells as *infravision*. An intact remorhaz eye will bring 1-10 gp; fluid and remnants, up to 1 gp per flask.

Terror in the dark

IMy name is Anna. I am alone in my bedroom, once again. I spend much of my time here, lying in bed, thinking, and wishing. I wish I could be up and about, like other children, but Father says I must stay in bed. My fever is high again. He worries so.

I wish I could go visiting again, but I'm not sure exactly how to go about it. It just happens. I can't really control how, or when, it happens, but I wish it would happen now. Sometimes it gets so lonely.

Father doesn't believe that I go visiting at all. Neither does the doctor who comes to see me. I heard them talking about it once, when they thought I was sleeping, and they said things like "fever dream" and "delirium." Besides, Father doesn't know it, but I visited him once, so I know what he really thinks.

He worries about me. An awful lot. He's afraid that I'll die, like Mama, and then he'll be all alone.

I feel sorry for Father. He spends so much of his time being very sad, and he puts so much effort into being brave in front of me. I wish I could tell him that I know exactly what he's feeling. I mean tell him and have him really believe me, because it's true. I *do* know, I've been right there in his head, and I know how terribly sad he feels. But he'd think I was only trying to comfort him, and he thinks that's his job, to comfort me. And I can't tell him about my visiting him, because he doesn't believe in that.

But it's true.

I've visited many different people. Some of them, like Mrs. Chandler in the village, I know. I visited her when she was helping a calf be born. Some of them are people I don't even know, like

1. Contrary to popular belief (and many an artist's depiction), the standard roper does not have tentacles waving around in all directions. Rather, it has a series of six sticky strands, three on each side, that it normally keeps within its body cavity. However, these strands can be extended at great speeds to capture prey. Once "fired," the strands cannot be manipulated by the roper, other than by being drawn back into the roper's body, dragging prey to the creature. On the other hand, the storoper, or "stone roper," does have 20'-long tentacles which it keeps extended from its body at all times, and this no doubt adds to the confusion.

THE ECOLOGY OF

the Roper

by Johnathan M. Richards

illustrated by Lorelle Ahlstrom

the time I visited a little boy who lived far away in the cold. He had a house that was made out of ice! And even though he was littler than me, his father had made him a spear of his very own, and he was learning how to hunt!

Once, I even visited a monster.

I still get goosebumps thinking about it, even though it was months ago. I've never visited it again since. But I think about it, and sometimes it gives me nightmares.

It started out the way it always does. I was in bed, with a fever, and I was kind of asleep and kind of not. It's sort of like having a dream but being awake at the same time and knowing that it *isn't* a dream. It's hard to explain. I was in bed, and I was floating in my room, looking down at my own body in the bed, and I knew I was going to go visiting.

I didn't know who I was going to visit, because I never do. I never know where I am going, either. Even when I'm done

visiting, I never know exactly where it is I've just been. Like the little boy who lives in the cold place. I can still remember him and what it looks like where he lives, but I have no idea where that is, what direction, or anything. The same thing was true when I visited the monster. I don't know where I went to go visit him or how far away he was from me, because it's almost like it doesn't take any time at all to get to where I'm visiting. Just *whoosh* and I'm there.

Usually, when I get to where I'm visiting, I see right away out of the person's eyes and can "hear" what they're thinking. It wasn't that way when I visited the monster.

First of all, it was very confusing. It wasn't at all like visiting a person, or even anything *like* a person (I visited an elf once, and he was pretty much like a regular person). My body felt strange. I didn't have any arms or legs, just lots of little wiggly toes under my body.¹ My

Underneath the roper's body are its many cilia-like appendages. These provide the roper with its limited movement rate and are able to excrete the same sticky substance found on the ropers web-like strands. This anchors the roper when it drags large prey toward itself and also allows it to climb walls and hang from ceilings.

2. Ropers have a rough surface exterior, similar to rock in both appearance and texture. They are able to alter the color of their skin (which is normally a yellowish-tinted grey) in order to blend in with the rock surrounding them. Their tough outer skin not only gives

ropers AC0, but it also prevents the roper's body heat from being detected by infravision. Furthermore, it is a good insulator, causing the roper to suffer only half-damage from cold-based attacks. On the other hand, ropers are unusually vulnerable to fire, saving at -4 against fire-based attacks.

To further their camouflage abilities, ropers are also extremely malleable beings, able to squeeze their bodies into a variety of shapes that help them to blend in with their environment. They can easily be mistaken for a stalagmite or a stalactite. By compressing its body down, a roper can assume a boulder-like

skin was hard on the outside, but kind of squishy on the inside, like it could be squashed into all kinds of different shapes, like clay.² And I had only one eye, in the middle of my forehead, but I didn't have a forehead. I didn't have a head, either. My "face" was at the top of my body, but all I had on it was one eye and a huge mouth with sharp teeth. There were ears, too, but they were tiny, and you probably wouldn't be able to see them.³

Once I had gotten settled into the monster's body, I started to take a look around and tried to figure out where I was. It was underground, that was for sure, because I was in this big cave, with all kinds of tunnels coming into it and going out of it. It was dark in the cave, I'm sure, because there weren't any lamps or fires or anything. That was the weird thing: I could see just fine, like it was only twilight.⁴

I think the monster was sleeping or something, because even though it had its eye open, it wasn't really paying attention to anything or thinking of any-

thing. When I visit somebody, I always see what they see and hear what they hear, and I even know what they think. That's how I know how frightened Father is for me. But the monster was just sitting there.⁵

So far, I wasn't scared. The monster was weird to visit, but it hadn't done anything scary. In fact, it hadn't done much at all except just sit. I started to get bored, being in a sleeping monster. I started poking around in its head, looking at its memories.

The monster was really strange! When it was born, it looked just like a little rock. Well, not a really little one, but little compared to the full-grown monster. For the first six weeks of its life, all the monster did was sit there, absorbing some kind of energy from the ground below it.⁶ It grew a little bit each day, but it never moved. Then, one day, it just kind of popped up, fully grown.

I was just starting to go through the monster's early memories and hadn't really found anything that exciting when the monster "woke up." It felt movement

up ahead, and turned its body (I can't really say it turned its head, but it did kind of twist just the top part of its body) to concentrate on what was coming.

To my surprise, it was an elf! I'm not sure what an elf was doing down there in a monster cave, but it was a strange elf anyway. His skin was black, like no elf I've ever seen. He ran like something was chasing him, because he kept looking back over his shoulder. He wasn't paying attention to where he was going. Which was too bad, because the monster got him.

That was the beginning of the scary part. The monster let out a really loud scream, which I could hear just fine, but the elf didn't even seem to notice it. Then, the monster shot a big gooey rope from its body at the elf, and it hit him right on his chest.⁷

That got the elf's attention, because almost as soon as the rope hit the elf, the monster started reeling him in like a fisherman reels in a fish. It was a weird sensation for me, because I could feel movement inside the monster's body

shape or fully flatten itself out so that it looks like a mere lump on the cavern floor. Due to this camouflage ability, a roper encountered in an underground setting causes its opponents to have a penalty of -2 on their surprise rolls.

3. A roper has no sense of smell. A very limited sense of touch is confined mostly to its cilia, to aid it in moving around. The roper's thick skin does not permit much feeling to penetrate. In fact, it is theoretically possible to sneak up on a roper from behind and knock it lightly on the back of its "head" without the roper being aware of the transgression. To date, however, no one has been found willing to put this theory to the test.

4. The roper has infravision capabilities to a range of 60'.

5. Ropers don't so much sleep as go into a light trance. While in such a state, they are aware of their surroundings and can readily return to a fully-alert state if necessary (if potential prey or a threat to it approaches). The trance is a way of preserving energy, much like hibernation, although the trance seldom lasts longer than a day or two. Since the roper can see only what is directly in front of it during its trance, it usually positions itself in a corner or flattens itself on the wall or ceiling of a cavern, where it is less likely to be approached undetected.

6. Ropers reproduce asexually. A roper "seed" is dropped off from the parent's body, and this "seed" looks exactly like a large rock (probably for protection, since an immature roper has no means of attack, and its main source of sensory input, its single eye, is buried in the creature's interior, until it "hatches" as a fully-grown roper). Over the next 2d4 weeks (depending on the size of the "seed" and the

depth of the Underdark), the immature roper absorbs the magical emanations of the Underdark, which allow it to grow and are also responsible for some of its magical abilities — primarily, its Strength-draining strands and its high (80%) magic resistance.

As the roper's magic resistance is derived from the energy it absorbs from the Underdark, DMs might wish to rule that roper seeds that develop close to the surface (where the magical emanations are weaker) end up with a lower magic resistance — anywhere from 10-60%. In any case, once a roper "hatches," its magic resistance is fixed and does not fluctuate if it moves deeper into the Underdark or closer to the surface world.

7. Like the bat, the roper uses echolocation to find its prey. Since the roper has only one eye, it has a lack of depth perception. This would ordinarily cause it to be a poor shot when trying to "rope" prey. However, by sending out an ultrasonic pulse and hearing the echo, it is able to sense its surroundings with great accuracy. In fact, a roper can use its echolocation ability to target prey even in conditions of absolute darkness. It can likewise sense invisible creatures without penalty; however, the roper uses its echolocation only when actively hunting prey. While it would still be able to "see" a wizard it was fighting after the wizard cast an *invisibility* spell on himself, it would not be able to detect an invisible character walking past it down a dungeon corridor unless it was actively hunting at the time. The range of a roper's echolocation is 60.

Since echolocation is a hearing-based sense, it can effectively be negated by the successful casting of a *silence 15' radius* spell. Note that with the roper's 80% magic resistance, the use of any spell on a roper is usually doomed to failure, but a *silence 15' radius* spell cast on a

potential roper victim masks it from the roper's echolocation sense. In this case, the roper is aware of an area of silence, but since its ultrasonic screech cannot penetrate the radius of the spell, it must rely only on its monocular vision in order to target any creatures in the spell's area of effect. In this case, the roper is at -2 to hit due to its lack of depth perception. A *deafness* spell has the same effect, but this spell must be cast directly on the roper — and make it past the creature's magic resistance.

8. The roper can fire only one strand per round, at a range of 20'-50', but once it hits, the captured prey is drawn 10' closer to the roper each round thereafter, as the strand is pulled back into the roper's body cavity. The drawing in of prey is automatic; thus a roper need not concentrate on reeling in a strand, and is free to fire additional strands in subsequent rounds. Each strand can pull up to 750 lbs. and, due to the roper's magical nature, temporarily (for 2d4 turns) drains one-half of the victim's Strength unless a saving throw vs. poison is made. The Strength loss begins 1d3 rounds after the strand's adhesion to the victim. Multiple strand attacks are possible against a single victim, and in such cases the effects of the Strength drain are cumulative. For the purposes of roper attacks, treat warriors with exceptional Strength (18/01 to 18/00) as having a Strength of 18, and round all fractions down.

To escape a roper's strand, the victim must either make a successful Open Doors roll or cause at least 6 hp damage in a single stroke with an edged weapon. The strand is AC0, and damage to the strand causes no hit point loss to the roper. Severed strands grow back in the course of a week.

Ropers have been known to use their strands in an unusual fashion: by firing several

where the gooeey rope came from, almost like a snake squirming around.⁸

The elf grabbed a knife from his belt, and started hacking at the rope, but he wasn't strong enough, because he was getting closer and closer, until he was close enough for the monster to open up really wide and bite the elf. It was horrible, because the monster's mouth was so big that he fit the elf's whole head, neck, and shoulders into it before he bit down. The elf wiggled a little bit, then was still. I knew he was dead.

I was very scared, and I wanted nothing more than to return to my own room, to my own body, but I couldn't. I was trapped in the monster's body, and I couldn't get out. I couldn't even close my eyes or look away. So I sat there and watched the elf get eaten, body, clothes, and all.⁹

Once the elf was in the monster's stomach, it went back to its nap, or whatever it was. It didn't get to stay that way very long, because there was more noise coming down from the passageway. It was three more elves, dressed the same as the first one, and with the same dark skin. Two of them had swords in their hands and funny little bows and arrows strapped to their arms. The other was a lady elf with long, white hair. They came running into the cavern, and it seemed like they were chasing the first elf. That made me feel a little better, because maybe the first elf was bad or something and these three were trying to put him in jail. Anyway, at the time, I hoped that was the case, because I felt so bad about the monster killing him.

The three new elves came along the same way, toward the monster, and I wished that I could call out a warning. Then I got a shock, because right as I was yelling in my head, the monster gave a loud shriek. I thought I might have made it make that noise, but then

I remembered it had made the same noise right before it attacked the first elf.

Another sticky rope shot out from the monster, and hit one of the new elves in the arm. He dropped his sword when the monster tugged him closer, and the other one jumped forward to try to cut the rope. The lady elf backed up and started doing some magic, which I was glad to see, because maybe they could kill the monster. Then I got scared, because I didn't know what would happen to me if I was still visiting the monster when it died.

The monster only had one eye, and it was concentrating on the two elves, but out of the corner of its vision I could see the lady elf vanish from sight. I never had gotten to see anyone turn invisible before.

By the time I turned my attention back at what the monster was doing, it was too late for the elves. The first one had shot a little arrow at the monster, but it bounced right off of its skin without hurting it at all. The second elf, while trying to cut the rope from his friend, got tangled up in two ropes of his own and was dragged closer too. The first elf got close enough for the monster to bite him, and it did. It felt like the elf's whole head came off in the monster's mouth, but then he let go, and let the elf's body fall to the ground.¹⁰ The second elf was screaming out as he struggled to free himself with his sword. I think he was probably calling for help from the lady elf, but I guess he didn't know she was invisible and maybe thought she had run away. In any case, it didn't do any good, because even though he finally cut one rope off of him, the other one dragged him in until he was close enough for the monster to bite him to death too.

Once both of the elves were dead, the monster sucked its sticky ropes back into its body and started making those

strands on the cavern ceiling overhead, then releasing the adhesive cilia keeping them in place and "reeling in" their strands, they can pull themselves up to the ceiling at a remarkable speed, much quicker than if they had walked up the surface of the cavern wall with their cilia. Such maneuvers are rare and are usually performed when speed is of the essence (such as to avoid a lava flow or a black pudding).

9. As a fully-grown roper can stand 9' tall, it can swallow creatures of up to medium size. Lacking hands or arms (the strands are good only at dragging objects closer, like a winch), the roper swallows creatures whole if possible. The process of swallowing any creature larger than size S, however, takes some manipulation on the roper's part; as a result, there is no

chance of it swallowing creatures whole in combat. Instead, it uses its bite to kill the victim, and then goes through the process of getting the meal into its mouth. Some ropers have been known to clamp down on an opponent and then shake it back and forth while clenched its jaws, causing an additional 5d4 hp damage each round until the victim is dead.

10. A roper can digest only one creature of size M at a time, but this won't stop it from attacking additional prey if opportunity presents itself. In such an instance, the roper attacks and kills its prey, then lets it sit in a heap while it digests its current meal. The digestion of a medium-sized creature can take up to a full day, after which time the roper swallows its next kill. A roper with a grisly

A World With Trees...where the trees you plant create cool, quiet neighborhoods

Trees Make a World of Difference™

Trees Make a World of Difference. Between drab, barren yards, and cozy, sheltered homes. Between hot, sunbaked streets, and cool, shaded neighborhoods where bird songs fill the air.

By planting trees, you can increase the value of your property up to 15% or more. At the same time, you'll make a personal, positive contribution to a better environment.

The trees you plant will remove carbon dioxide from the air, produce oxygen, and give wildlife a home.

A World Without Trees

And trees help conserve energy. They can lower your heating bills 10-20%, and cut cooling costs 15-35%.

Find out how trees can make a world of difference for you, and your neighborhood. For your free brochure write: Trees For America, The National Arbor Day Foundation, Nebraska City, NE 68410.

Arbor Day Foundation**

high-pitched shrieks again. I'm sure the lady elf couldn't hear them, but I bet she was surprised when the monster turned its "head" to look straight at her. The monster kept shrieking, over and over, and then it started moving toward her on its little crawly-feet.

I couldn't see her, but I "knew" she was there. The monster knew where she was from the noises it made. I wish it was more like sight, though, because I would have liked to have seen her face when she saw the monster coming after her. She must have been scared to know it could kind of see her, even though she was invisible.

She was pretty smart, turning invisible and all, and I think she must have seen one of these kinds of monsters before, because she was careful to stay far enough away that the monster couldn't hit her with one of its sticky ropes. At the same time, chasing the elf lady didn't seem like such a smart idea to me. The monster moved much slower than she did, so there wasn't much of a chance to catch her. Why did it need to catch her when there were still two dead elves it left behind that it could eat? Then, when I started peeking into the monster's thoughts, I saw what it was up to.

I tried calling out a warning, but that was no good, since I was just visiting. The monster wasn't trying to eat her at

all! But by chasing her, it was making her back up away from it, to stay out of range of its sticky ropes. Unfortunately for the elf, it was also making her back up into the range of another of the monsters, and she didn't realize it until a sticky rope hit her square in the back. She screamed and fell to the ground and kept on screaming.¹¹ The monster I was visiting turned away and moved back to where it was before, by the two dead elves, so I didn't have to see the elf lady get eaten. It didn't take very long before her screaming stopped.¹²

Once the monster got back into position, it went back into its trance, seemingly just happy to sit there. Every once in a while its stomach would make a funny noise, and there would be a bubbly sensation from deep within.¹³ The monster stayed like that for the rest of my visit, which fortunately didn't last much longer. Then it was *whoosh*, and I was back in my own bedroom, in my own body, and I cried and cried because of what I had seen. Father came in to comfort me, telling me that it was just a bad dream, but I knew that it wasn't. He felt my head and said I was burning up, and he got me some more of my medicine. I tried to sleep afterward, but I was too frightened. I kept thinking of the monster and scared myself thinking about what it would be like if it came out

of its cave and started eating people.¹⁴

That was the scariest visit I ever went on. I was afraid of visiting for a long time after that, afraid that I'd end up in another monster and see other people get killed. As usual I didn't have any choice in the matter. Two weeks after the monster visit, I ended up visiting an old lady who lived in a big castle, and she was nice. A few days after that I visited the boy who lives in the ice house again. I haven't visited any monsters since. Just that one.

For that matter, I haven't visited anyone for a long time now. My fever's higher than it's been in a long time, and it seems even harder to sit up in bed and look out of my window. The medicine from the doctor doesn't seem to be helping. Father is very worried.

It's been so long, but I think, very soon, I'll be going on another visit. Only this time, I don't think I'll be coming back. Father will be sad, and I will miss him. But I think, before too long . . .

. . . I'll be going to visit Mama.

Johnathan M. Richards is an Air Force officer currently stationed in California. His work has appeared in both DRAGON® Magazine and DUNGEON® Adventures.

"future meal" waiting at the base of its body is less likely to cause surprise to opponents; DMs might wish to limit the surprise penalty to -1, or do away with it altogether.

11. Drow elves have a healthy respect for the roper, recognizing it as a power to be feared in the Underdark. No doubt it is for this reason that the yochlol, or "handmaiden of Lolth," adopts a form similar to that of a roper when appearing before the drow on the Prime Material Plane.

12. As solitary creatures, ropers rarely cooperate with each other and are usually found together only in areas where the hunting is good, but their high intelligence and evil cunning can make them extremely dangerous adversaries when they work together.

13. The roper's digestive processes are nothing short of incredible. Its powerful stomach acids are able to digest almost anything, from the softest flesh to the hardest metal. Two notable exceptions to this are platinum and gemstones, which the roper is unable to digest. For this reason, these substances are often found undigested inside a roper's stomach (3d6 platinum pieces, and a 35% chance of holding 5d4 gems). However, they are put to good use, grinding up the roper's meal much like the stones swallowed by some birds for the same reason.

The stomach acid from a slain roper is worth about 4 gp per ounce to an alchemist. A full-grown roper can supply 80-120 ounces of the acid, but it must be carefully harvested and stored only in platinum vials. Other roper by-products include the glands that produce the

sticky glue coating its cilia and strands (the glue itself sells for about 8 gp per ounce, or 25 gp per gland, of which the roper has a total of four) and the eye, which is considered a delicacy among certain humanoid races (prices vary). Roper glue is a valuable component used in the preparation of sovereign glue.

14. Fortunately for surface-dwelling people, ropers prefer an underground existence. They leave the Underdark for the surface world only if prey becomes too scarce, and then only at night, for they find bright light uncomfortable; however, lest any spellcasters get any smart ideas, a *continual light* spell cast on a roper's eye makes for a poor weapon, as the creature can rely on its echolocation to target prey without using sight at all.

Walls

Continued from page 27

anyone within 50' of where it finally strikes must make a saving throw vs. breath weapon or be deafened and stunned for 1-2 rounds.

Table 1 in this article is based on Table 52, Structural Saving Throws, found in the DMG. The structure must

match the number below or better to remain undamaged by the battering ram. A failed saving throw indicates that a number of cubic feet of the material is broken apart/destroyed/breached equal to the amount the roll was missed by. For example, a mage uses a *thunderstrike rod* on an earthen embankment. The defenders make an abysmal saving

throw roll of 2, and thus an amount of packed earth flies apart in all directions equal to $(5 - 2 = 3)$ cubic feet.

Steve Berman spends most of the year in New Jersey waiting for the autumn season when he can attend the local Renaissance faires. He has yet to lay siege to any castles.

Roper

“Down here in the cold, the shadows moan and twist. I hear screams and whispers spoken in the hollowed dark. I search for truths too old for mankind—the ancient wisdom I seek is too sharp, too stark. I have heard the folk-rhymes of you surface folk, warning you away from crevice and cave; you should have heeded them. My touch has sapped away your strength and made you easy prey. Now I shall learn a great deal about the real you as I slowly eat your flesh. First, tell me of your childhood...”

—from a roper to its victim

The torchlight casts strange shadows among the rocks. Stalactites sway to the flicker of the fire, but suddenly one moves against the cast of the light. A jagged fissure opens noiselessly across its shale-like side. Rock moves like sinew, and strands of stone peel off and writhe like hungry serpents before lashing out across the cavern. Clutching and grasping, the stony tentacles reach out to drag the weak toward a waiting maw of bone-crushing teeth.

OVERVIEW

Ropers rule the darkest, most forlorn caves beneath the earth, feasting on the flesh of anyone foolish or ignorant enough to trespass. Roper territory riddles the crust of the world. These strange mazes, wrought either by the ropers themselves or by whatever greater power brought these abominations into being, are filled with stalactites like giants’ teeth, and strange arrays of stone to boggle any architect’s wildest fever-dreams. Here ropers creep through the bones of the earth and pry untold secrets from walls of stone. They hide among outcroppings of rock or skulk around stalactites, lashing out of the

darkness with wiry strands of powerful sinew, crushing the breath from men and dragging them like screaming babes into maws of grinding stony teeth. Their rocky hides crave the dark, and they blend into the palette of the surrounding environs—most victims don't even perceive the danger until their limbs are encircled by the ropers' strength-sapping strands. Stone and rock are their silent allies, hiding them from the prying eyes of trespassing explorers until it is too late. Treasure hunters who leave no stone unturned eventually fall prey to a roper's crushing embrace as a stalagmite reveals itself to be a monster.

This stealth is hardly necessary most of the time. A roper's hide is nigh-impenetrable, turning aside axe and blade like the most ancient, dwarven-wrought stone, and even potent arcane assaults simply slide from their shale-like forms. Their ability to coordinate six attacking strands at once allows these devastating monsters to easily neutralize an entire party of interlopers from a distance. Ropers are deadly adversaries in a stand-up fight, let alone when attacking with complete surprise.

Though these prodigious predators possess the strength to tear a man in quarters or bite him clean in half, few adventurers realize ropers also possess a canny intellect and a strange philosophy spurred by darkness and agony. These cryptic killers gather in deep caves far from the light of men, lean their rocky points together like monks at vespers, and share strange mutters in the dark. What fell musings these cabals of ropers share remain forever a mystery to surface dwellers, but the urgency that drives their meetings cannot bode well for mankind.

ECOLOGY

Ropers resemble uncarved stone in every respect, and until their strands peel from their frames and maws crack open wide, they are almost impossible to discern among rocky environs. The average specimen weighs just over a ton, and towers 10 feet in height when standing erect. A roper can hunch its form to resemble a simple boulder or outcropping of stone, or when raised up can appear as a stalagmite or roughly hewn pillar. Some look like simple conical stalagmites, but others' shapes vary widely and even more are mutable, allowing them to appear as a bevy of rock formations to further confuse trespassers. Their hides are harder than most stone and half a foot thick.

Ropers are amazing creatures—their stone-like qualities don't stop at their exteriors. They have no blood, but instead strange contractions pump fine dust through rocky canals within the roper's innards. Their strands are filaments of grainy, stone-like sinew, at once as hard as marble yet as tensile as a worked-leather whip. The strands are capable of delicate movement, but strong enough to strangle an orc to death, and strange pores in the roper's strands drain away a man's strength. The filaments numb the victim's

SILENT AS STONE

You move over stone with such natural poise that you are nearly noiseless. You are skilled in taking down a single foe in a party in absolute silence.

Prerequisite: Roper, Stealthy.

Benefit: You gain a +4 bonus to all Move Silently checks in rocky environments and may use Move Silently at no penalty while climbing. If you attack with your strands in the surprise round, you may automatically choke the victim and cover his mouth with a strand to quell any sound. If you hit with a strand in the surprise round, on your next turn make a Move Silently check at –5 opposed by the Listen check of nearby creatures; if you succeed, you silently drag your opponent 10 feet toward you, and your target's allies are unaware your target is missing (barring precautions or activities that would make this obvious, such as being tied together, your target carrying the only light source, your target speaking before the attack, and so on).

muscles by constricting pressure points throughout the body, eventually resulting in utter paralysis, leaving him completely helpless.

A roper senses prey by means of strange, tiny filaments studding its pointed crown. These filaments behave for the most part like any normal animal's eyes, save that a roper can perceive through all of them in conjunction. It's possible these integrated eye-stalks are what allows a roper to attack with all six strands in concert.

A roper's maw can seal almost completely shut, appearing as solid, unbroken stone. When opened, this cavernous orifice spreads 2 feet wide. The circular saw-like action of a roper's jaws can crush granite, and makes even shorter work of bone and gristle. Most organic matter is spewed back out eventually. Flesh and meat are indigestible to a roper, but bone nourishes these brutal creatures, ground to dust by the gnashing action of the roper's crushing insides.

The origin of this bizarre rocky creature is a mystery. The ropers' freakish obeisance to Rovagug inspires many scholars to posit the Rough Beast's hand in their creation, but others claim these strange monsters are the result of some mad wizard's meddling. An ancient tale speaks to a gout of Rovagug's blood spilt below the earth, tainting the insides of an ancient cavern, and it is said that from this sick, polluted crucible the first ropers were born.

Alternatively, more than a few sages have pointed to the similarities between ropers and mimics, claiming a common ancestry. One noted sage, the withered elf Jacorsis, published his theory putting forth both the mimic and roper as the products of experiments conducted by a nameless archmage from antiquity. Certainly similarities

in their rocky structures and their ability to camouflage their appearance substantiate his research. It is also not uncommon for cabals of ropers to enslave or cohabitate with mimics.

Whatever their origin, ropers now firmly guide their own destiny toward some cryptic goal.

HABITAT & SOCIETY

Ropers prowl the deepest chasms of the world, scorning the sun and the civilized world of the surface dwellers. They are at home among rocks and crags only, and cannot abide other environs for long. The few captured and taken from the Darklands by particularly skilled darkhunters and adventurers soon wither and die unless returned to the lightless caverns of their birth—not out of any physical need, but rather a psychological malaise that makes them will themselves to death if they cannot escape to their preferred terrain. They favor caverns riddled with craggy ridges, sanity-crushing spirals of sweeping stone, basalt towers, jagged tooth-like stalactites, or other bizarre formations of rock. Most ropers are very particular about their lairs, choosing their caverns based on whatever strange tastes toward stone formations they harbor.

Many ropers also enjoy icy climes, and entire cabals numbering in the hundreds gather beneath glacial sheets. There in ancient ice caves they ponder whatever fell philosophies spark their inscrutable intellects. Ropers delve into the deepest meanings of darkness, pain, and the eternal nature of stone. These cabals are little known, and most sages are completely unaware of the social aspect of these strange subterranean predators. Many adventurers dismiss ropers as simple skulking threats, but those few to encounter a cabal and become mired in its devious web know the true terror of roper society. Their pensive exploration of agony and terror is unlike any other race's. They are obsessed with tormenting intruders, not because they enjoy it, but because they believe the dread experiments they conduct lead them to some gross enlightenment. They have no morality or mercy to which to appeal.

Ropers favor the flesh of humans above all other prey, but taste has little to do with this preference. Ropers take perverse pleasure in eating intelligent food capable of holding a conversation. They thrive on the pain their food

experiences, and the higher the intellect of the devoured, the more a roper savors their agony. The animal pain experienced by a lower creature is nothing compared to the dread realization and succulent anguish a sentient person undergoes as he, paralyzed with weakness, watches the roper slowly munch off his limbs.

While ropers attack from ambush, they do not always kill their prey immediately. Ropers are conversant creatures, finding the art of discourse to be one of life's most luxuriant pleasures. Once a victim is sapped of his strength and rendered harmless, a roper may endeavor to entreat with him before it grinds him to paste and gulps him down. It delights on each philosophical morsel offered

by a guest, making the devouring of his flesh all the more savory when the conversation begins to wane. More than a few adventurers have delayed their demise long enough for help to arrive by keeping a roper's intellectual interest. After the limbs are deadened, a sharp tongue and quick wits are still potent weapons against death at a roper's maw. Anyone able to wax philosophical might stave off the inevitable for days, perhaps with one or more limbs gone, the wound bound with a roper strand as a tourniquet.

Ropers enjoy slowly eating a particularly interesting conversationalist, keeping him alive for as long as possible and observing changes to his reasoning as he is devoured over time. Ropers take special delight in the way pain warps a fascinating mind, and the realization that one is slowly being chewed to paste provokes startlingly enlightened musings. Ropers have a saying, impossible to translate completely, that means roughly, "You cannot truly know another until you have eaten him—slowly." Ropers claim they know a living meal better than his dearest friends, lovers, or family. As the victim confronts his horrid death, he often opens his heart wide to the strange thing eating him, and the epiphanies he reaches in the throes of death are often illuminating in the extreme.

These epiphanies, especially those capable of shaking up their twisted psyches, are the only truly valuable experiences to ropers. They desire a meal that can awaken them to new and strange passageways in the mazes of their murky minds; some will even pay a high price to those who can bring particularly demented sages or warped wizards to their waiting maws.

CRYSTAL SIGIL

CAMPAIGN ROLE

Ropers are wonderful stealth killers, and as masters of ambush they add an exciting and unexpected encounter to any subterranean jaunt through the Darklands, or even near-surface caves. However, a roper also makes for a wonderful mystery, such as an unusual cavern where any who enter never return, a rash of strange disappearances near a deep chasm, or a rickety bridge spanning a crevice where lone travelers don't make it across. Perhaps the first time the PCs explore this traveler-swallowing place, they are able to pass unmolested (the roper may be out of its lair, or perhaps lost in thought, or waiting for a solitary creature to pass by). The PCs might then have to make a difficult Spot check on their second pass through the roper's domain to discover a certain rock formation has moved, maybe giving them a few precious moments before the beast springs a deadly ambush.

Beyond simple monsters, ropers possess a considerable intellect and a deep, timeless wisdom. The strange cabals they gather could pursue any bizarre agenda toward which their twisted philosophies push them. Roper conspiracies could have far ranging consequences, resulting in the slaying of entire populations of surface dwellers. There are rumors of entire villages plunging into mile-wide sinkholes, their people swallowed up by inky darkness, their terror-filled cries echoing up from below for long days of horrific torment. This crude excavation is a simple plot compared to some of the ropers' more nebulous and convoluted schemes. Their twisted thoughts, too strange for a sane man to comprehend, lead to all manner of malfesance. Unraveling their labyrinthine plans may prove an action-packed endeavor to any stalwart party of adventurers... as long as they remain unafraid of the dark.

TREASURE

Ropers keep only what stimulates their dark thoughts: tomes of arcane lore, strange objects of power, historical oddities, and occasionally objects deemed of personal value to their favorite meals (the odd wedding ring or father's sword bequeathed to his son, etc.). If a roper finds a visitor particularly succulent, offering up delightful conversation before being ground to pulp in its maw, then the roper usually claims some trophy by which to remember this "old friend." Ropers also favor especially lustrous trinkets, anything they can gaze into for hours and lose themselves in thought. Especially shiny gold or flawless, smoky gemstones the size of a man's fist can entrance a roper for days.

Ropers are far more cunning than most give them credit for, and they always make use of any particularly powerful magic items found on their prey. Anything beyond their understanding to employ they bring to

STONE CLINGER

All ropers have a propensity for climbing, but some cling to rock like moss. You can even hang upside down from the ceiling of caverns or stone chambers appearing as stalactites. You can fall from a great height, piercing a victim below or crushing him flat.

Prerequisites: Roper.

Benefit: You gain a climb speed of 10 feet and all the benefits of having a climb speed (bonus to Climb checks, always able to take 10 on Climb checks, and so on). You may hang upside down indefinitely from the ceiling, and then fall on any creature passing below, dealing 2d6+6 crushing or piercing damage (your choice).

BANDYING WITH ROPERS

Many more pensive ropers hold off on devouring foes until they've tired of their conversation. They grapple foes with their strands and weaken them until their victims couldn't win a wrestling match with a puppy, then leisurely entreat with their meals-to-be, picking their brains for interesting thoughts or ideas before finishing them off. A particularly canny adventurer possessed of deep knowledge or enlightening wisdom might stave off death for hours, and even distract a roper long enough to regain some Strength and surprise the creature with a daring escape.

Every hour a roper entertains with a victim, the victim can attempt a Knowledge, bardic knowledge, or Wisdom check. The DC of the first check is 10, but every hour thereafter the successive checks increase by +2. If a victim makes a Bluff or Diplomacy check equal to the roper's DC, the monster is so engrossed in the discussion it doesn't bother to weaken the victim again.

At the GM's discretion, a PC who fails a check could try posing a riddle to the roper instead. Some ropers are suckers for a good riddle and enjoy a battle of wits using riddles as weapons. If the GM has a roper encounter planned, its worth prepping some riddles in ascending difficulty, and as long as a PC can keep answering them, he stays alive for another hour per riddle. If the player is having difficulty with a riddle, allow a DC 15 Wisdom check for a clue.

their cabal's next moot in hopes that another, wiser roper might teach them its power. Though they cannot use spell trigger or spell completion devices, and most humanoid gear won't fit them, they can use rings, necklaces, belts, cloaks, and hats, though wearing these things may make them stand out among a collection of stalagmites, and to offset this the roper often tries to look like a boulder or squat pillar upon which someone has left some treasure.

VARIANTS

Common ropers are merely the most often encountered. Their race is bizarrely diverse, perhaps due to the mysterious link to mimics in their origin. Some ropers are far more mutable than their cousins. These ropers, sometimes called molting stranglers, shed their external rocky carapace every few months, sloughing it off like crusted dead skin. Each time their skin sheds, the ropers' form becomes less permanent and more changeable. They gain the ability to assume other forms, taking on diverse shapes, even mimicking the appearance of other creatures (in the same manner as a mimic). Additionally, their shed skin sometimes clings to a miserable semblance of life, acting as a simulacrum of the roper for a short time before dying horribly. The molting stranglers often use these pathetic shed skins to lure enemies into traps, hastening the end of their sick half-life.

Common ropers are composed of a rock-like substance similar to granite or marble, but some varieties are composed of different stone. One of the more dangerous mutations is made of a stone similar to basalt. These basalt ropers, also called vulkards, lack their cousins' vulnerability to fire, and instead are immune to it. Additionally, these ropers feed on fire, growing stronger and healthier when exposed to it; any attack against a vulkard that deals fire damage heals 1 point of damage for every 4 points of fire damage it would otherwise deal. A vulkard gets no saving throw against attacks that deal fire damage.

Far more insidious and dangerous breeds of ropers exist. Sigil crags, a strange and timeless race of ropers, manifest bizarre and powerful runes of crystal on their rocky exteriors. These sigils of power crystallize after a particularly interesting meal, which usually takes days instead of hours, and most often when the prey is a powerful spellcaster. Sigil crags often munch down the caster's hands first, leaving him incapable of casting spells with somatic components, and then explore his secrets during a lengthy feast. The secrets coughed up in the crushing embrace of a sigil crag as the hideous thing slowly masticates a caster's limbs are unthinkably powerful. Each sigil covering a sigil crag's hide allows it to cast a *symbol* spell of the GM's choosing once per day. Most sigil crags are only fortunate enough to enjoy a few sigil-worthy meals in the course of a lifetime, but particularly old and powerful ones are encrusted nearly completely in these dread runes. Sigil crags are CR 13.

A particularly gruesome breed of roper is the dreaded shardstriker. The strands of a shardstriker are jagged, stone-like threads which rend opponents to shreds even as they ensnare them. These brutish degenerates of the roper race are far less philosophical than the others, but they make up for this shortcoming with a healthy dose of sheer viciousness. These demented ropers slice victims to gory

bits, often shredding them with all six of their strands. A strand attack by a shardstriker deals 1d8+4 slashing damage as well as dragging the foe. If a shardstriker hits a single foe with more than one strand, it also rends him for an additional 2d6+6 slashing damage. Shardstrikers are CR 13.

ROPERS ON GOLARION

Ropers of Golarion worship Rovagug, whom they view as their creator. Their insidiousness knows no bounds, and their cabals explore darkness and torment for several reasons, but most pursue one goal alone—discovering the meaning of their existence. They philosophize over the mysterious, fell purpose for which Rovagug brought them into being, searching for an answer in the agony of captives and the twisted secrets of deep caverns scarring the face of the world. Some sages suggest they pursue a greater and more deadly purpose, with far-reaching ramifications that could leave entire civilizations in ruins.

Before the Age of Lost Omens, the elven geographer, explorer, and bard Talsindro Yarmaht endeavored to map the known territory of ropers. His efforts, spanning 5 centuries, nearly consumed him. Shortly before his disappearance, strange letters and crazed, spiral-patterned maps claiming some “calamitous discovery” related to his work reached his granddaughter and her human husband Drelzarg Ice-Eyes, a noted Pathfinder of his day. These letters and the accompanying maps supposedly showed a series of chasms infested with ropers in the shape of some strange and ancient glyph; they are still locked away in the Grand Lodge of Absalom, and anyone who gazes upon these maps bleeds from the eyes ever after. Whether there is any truth to this long-spun yarn or not, roper gathering places remain a point of deep interest among many subterranean explorers and sages.

Perhaps even more disturbing are rumors of strange groups of ropers inhabiting ice caves in the Lands of the Linnorm Kings. Supposedly they are responsible for disappearing children and young warriors, and are called the Takers in the Ice. Worse, sometimes these disappeared folk return years later, shriveled and tortured, gone mad from cold and years of the demented ministrations of the icy ropers. Some crawl back with only one remaining limb, the others ending in chewed stumps and scar tissue. Most cannot speak, but those who can form words usually just blather bizarre trivia until their voices crack, their eyes filled with fear. The ropers do not kidnap folk from Irrisen, perhaps due to a pact with the ice trolls, or perhaps out of fear of Baba Yaga and her daughters.

In the Darklands region of Nar-Voth, a great cave called the Endless Gulf is home to vast numbers of ropers and other creatures that cling to its walls. In Sekamina, ropers prey on travelers trying to reach the Dying Sea.

ROPER

This large stalagmite suddenly twists to life, revealing a circular mouth full of jagged rocky teeth. Rope-like strands extend from its sides, lashing out at everything nearby.

Drag (Ex) If a roper hits with a strand attack, the strand latches onto the opponent's body. This deals no damage but drags the stuck opponent 10 feet closer each subsequent round (provoking no attack of opportunity for this movement) unless that creature breaks free, which requires a DC 23 Escape Artist check or a DC 19 Strength check. The check DCs are Strength-based, and the Escape Artist DC includes a +4 racial bonus. A roper can draw a

creature within 10 feet of itself and bite with a +4 attack bonus in the same round. A strand has 10 hit points and can be attacked by making a successful sunder attempt, but attacking a roper's strand does not provoke an attack of opportunity. If the strand is currently attached to a target, the roper takes a –4 penalty on its opposed attack roll to resist the sunder attempt. Severing a strand deals no damage to a roper.

Strands (Ex) Most encounters with a roper begin when it fires strong, sticky strands. The creature can have up to six strands at once, and it can strike up to 50 feet away (no range increment). If a strand is severed, the roper can extrude a new one on its next turn as a free action.

Weakness (Ex) A roper's strands can sap an opponent's strength. Anyone grabbed by a strand must succeed on a DC 18 Fortitude save or take 2d8 points of Strength damage. The save DC is Constitution-based.

Skills Ropers have a +8 racial bonus to Hide checks in stony or icy areas.

The Ecology of the Rot Grub

A brief lecture not easily forgotten

by Ed Greenwood

The scholar Tantras held up a wriggling thing in a wooden clamp, taking care not to touch it with his hands. "Brethren of the Council, behold — a rot grub." His eyebrows raised at the ill-suppressed sputters of mirth audible in the meeting-chamber of the Council, but he did not look surprised at the reaction. He had counted on it.

"Not magnificent, I'll admit," the sage continued with a faint smile, calmly twirling the clamp. "Certainly not as impressive as, say, a dragon, but often—" he paused to look around the darkened lecture room at his invisible audience—"just as deadly, if not more so."

"Dispense with the cheap theatrics," came an authoritarian voice from the darkness in the back of the hall. "We are not impressed with your wit."

The clamp stopped twirling. A cold light entered Tantras's gaze as he looked toward the rear of the hall. "I see" he said easily, his smile twisting. "But such mighty mages as are assembled here may have reason to

take an interest in the lowly rot grub. Those of you who are even now spending vast sums in order to learn the secret of achieving lichdom should think on the usefulness of a brainless, sightless body, tunneled into ruin by these creatures. Such a body might survive transformation — but then, it might not. And rot grubs will eat into carrion — yea, into anything organic their mouths can reach, including undead flesh as well as living."

The sudden stillness in the hall was unbroken for the space of a long minute. The writhing form in the grip of the clamp never ceased to move, straining to free itself. Tantras lowered his gaze to the mottled brown, tawny, and white grub.

"Well, say on, then," a nameless Council member grunted.

The clamp began again to rotate slowly in Tantras's hand. "My thanks, Brother," he said in an inflectionless tone, his smile deepening. "My part in the Converse tonight is admittedly not a matter of great import in the doings of states, nor yet a delicate point or discovery in dweomer-craft ... but I believe many of us here would do well, every so often, to think on

what is most basic in our existence. Aside from its value as an exercise in humility, such a practice yields practical information which may in time be of inestimable value. If Amurathor the Great had known what I am about to relate concerning the habits and nature of the rot grub, he might still be with us, and this Council a mere whimsy of outlawed, harried workers of magic. But he was ignorant, and he is gone, and we are neither.

"Harken, then: The rot grub, as you know, feeds on living flesh. With these—" he indicated with a wooden probe the successive rings of rasping, razor-sharp teeth at one end of his specimen—"they also burrow through offal, dung, dead flesh, and even such organic matter as loam or large plants. When burrowing, either for safety or to kill prey, a grub can cut away large gobbets of material and pass them rapidly, by muscular contortion, straight through its body, expelling them with some force." Tantras reached over and opened a metal box on the table beside him, revealing the topmost part of a large joint of mutton. He then held the clamp over the box and released the grub, ignoring the startled gasps from the front row of the audience. Twisting as it fell, the worm promptly vanished into the mutton, spraying tiny pieces of meat into the air from its burrowing hole. "As you see, it works with great speed, and it is this faculty that makes the rot grub so dangerous to man. All of you know that a rot grub will burrow to the heart of a man or any larger, living, and blooded creature in a very short time. Know now that rot grubs do this in order to breed.

"Rot grubs need flesh soaked in blood and rich in oxygen, such as that of the heart, in which to lay their eggs, for only in such an environment can the eggs be fertilized. They burrow there by instinct and lay a cluster of from six to a dozen eggs even if no other rot grub is present to fertilize the clutch. My experiments have shown that all grubs can lay eggs, and all can fertilize the eggs of others, although apparently not their own." Noting some stirring from the front rows, the sage lowered the wooden probe and gently poked at the mutton. "We are safe," he said, "so long as our friend is occupied."

The comment drew no laughter. The sage then reached into a pocket in his robes and brought out a slim, firmly-stoppered glass phial. "These are a bit small, but it is perilous to expose them to the air so near a live rot grub. In this phial are four rot grub eggs: small, green-white rubbery spheres a little less than the size of your smallest fingernail. As I've said, one rot grub lays a clutch of these, and if another rot grub comes into contact with the host creature, it will also burrow to the heart, locate the eggs by the scent and burrowing tube left by its predecessor, and exude a red, viscous fluid from its mouth as it rolls the eggs about and examines them. This fluid penetrates the

outer skin of the eggs. If the second rot grub arrives within twenty minutes of the laying of the eggs, successful fertilization occurs. Otherwise, the eggs die.

"Fertilized eggs and grubs can survive for long periods in carrion, even entombed corpses, or anywhere that affords protection from crushing, air, water, and extremes of temperature. They cease to move and function, and thus cease to require food, air, or like sustenance. The rot grub in this meat can wait here for a very long time for a live host — precisely how long, my knowledge at present does not answer, but at least two centuries, as the opening of the tomb of King Eurovan of the now-vanished realm of Nuvorene attests; a tomb-robber was slain by rot grubs then. In such a suspended state does the rot grub lie until vibration, the actual movement of their 'home' meat, or contact with warm, living flesh awakens it."

Tantras sighed and carefully closed the lid of the metal box with his probe. The automatic lock rattled and snapped shut. "And so it was with Amurathor, who like many of us believed that rot grubs shunned the taint of undead flesh. Yet it took but four of these little creatures to turn his enchanted and rotting body, reanimated by his sorcery into existence as a lich, into the skeleton which stands by the entryway to this hall — stripped of all matter but the very bone itself in a matter of an hour." He offered a side look to a particular spot in the back of the room. "Not bad work for cheap theatrics."

The sage dropped the wooden clamp onto the box lid and casually wiped his hands on his robes. "Behold, the rot grub. The most efficient of the natural scavengers, and the deadliest, for its size and repulsiveness lead all to underestimate it. Pray do not make this mistake yourselves. My last suggestion, my Brethren, is that you leave one of these—" he tapped the box with a finger "—with your most treasured magical devices and wealth in your vaults. A mundane defense, perhaps, but practical. No thief can resist opening a box. It has been a pleasure to speak with you. Good evening, and good fortune." □

ECOLOGY OF THE RUST MONSTER

by Shawn Merwin

illustrations by Adam Gillespie & Jason A. Engle

Cartography by Sean Macdonald

“Gather ’round, my children. You’ve asked for another tale, and another tale you shall have. You’ve heard me speak of the fiercest of the dragons that breathe fire and ice. I’ve told you about the deadliest of demons and the most nightmarish creatures from worlds beyond our own. I’ve heard tales of the bravest of warriors and most cunning of rogues, men and women brave enough to stand before villains so hideous that the very sight of them could kill a normal person. But listen closely, young ones, and I will tell you of a creature that even the boldest of heroes flees from!”

HISTORY

Sages the world over have many theories regarding the origins of the rust monster; however, none of them can say with any genuine certainty where the creatures came from or what the sources of their strange and destructive powers are. Doomsday cultists claim the creatures are harbingers of the end of civilization, while more exotic theories exist—such as the one stating the creatures were a mad wizard’s invention to ward himself against the impending

attack of the chain devils known as kyton. Each belief about the genesis of the rust monster is as wild and speculative as the next.

More reasonable experts on the matter—those who have had an opportunity to study the creatures—put forth a slightly duller but more plausible explanation: Rust monsters are creatures of the natural world whose habitats and proximity to metallic ore necessitated an evolutionary change. Scarcity of organic matter to act as food for the creatures forced a mutation that allowed them to gain sustenance through the intake of metallic material, or more precisely, *rusted* metallic material.

Much of the mystery (and the outlandish stories) behind the rust monster is a result of its habitat. The creatures, in their natural environment, tend to live deep beneath the surface, in proximity to the veins of the metallic ore that offer them sustenance. With a habitat so far removed from the population centers of most other creatures of the natural world, the rust monster is often associated with other creatures that lurk in the Underdark, particularly aberrations and other creatures from the Far Realm.

EARLY ENCOUNTERS

As the surface-dwelling humanoids achieved advances in technology, particularly in the areas of mining and smelting, the likelihood of interaction with the rust monster increased dramatically. Unfortunately, the same technology that allowed surface dwellers to delve into the depths of the earth—iron picks, steel shovels, copper pipes—ensured that the rust monsters would be seen as little more than vile and destructive nuisances. (The Dwarven word for the creature, and its translation

into other languages from the Dwarven, cannot be repeated in polite company.)

Ironically, the use of rails and ore carts brought more than a few rust monsters much closer to the surface. The rails on which the ore carts ran acted as a continuous feast for the creatures. The collection of large amounts of ore closer and closer to the surface drew the creatures ever upward, providing them with both the incentive to reach the surface and the means to survive and prosper once they got there.

ATTEMPTS AT DOMESTICATION

After the existence of rust monsters was confirmed and people learned more about their strange powers, enterprising individuals saw the potential for the creatures to be used as tools and weapons.

The first documented use of the rust monster as tools of civilized forces were in battles between denizens of the underworld, particularly the drow and the duergar. Spies and agents of each group attempted to release the creatures in militarily strategic areas containing metal: armories and weapon depositories, warehouses containing metal, fortifications made of metals, and so on. One well-placed rust monster could wreak more devastation on an enemy's infrastructure and supplies than a large number of troops or a costly ritual. When more became known of the strange abilities of the rust monster, these tactics also spread to the surface world. Warring nations, looking for any advantage in their prolonged conflicts, unleashed semidomesticated rust monsters with the hopes the creatures would weaken the enemy's infrastructure.

After use of rust monsters in warfare became known, individuals with the resources to procure the creatures used them in smaller instances of sabotage.

Rival businesses, mining companies, guilds, and even adventuring companies stooped to deploying rust monsters against their competitors. Often the collateral damage in these small conflicts spread far beyond the limits of the intended targets.

The uses of the rust monster in warfare and sabotage only added to their reputation as a nuisance and bringer of woe. More often than not, the creatures ended up doing more damage to their keepers than to the enemy. After a number of instances where rust monsters escaped from “farms” where domestication was attempted—resulting in the destruction of countless villages, towns, and cities—many civilized areas were forced to ban the import, domestication, and sale of the rust monster. In locations where the infrastructure makes use of metallic materials, the penalty for even possessing a rust monster can be as harsh as heavy fines, imprisonment, and even execution.

RECENT RESEARCH

Interest in the rust monster as a scientific curiosity exploded when it was learned, only a few years ago, that the creature can store *residuum* in its body after eating dweomered metal. Most of the earliest encounters with rust monsters involved only nonmagic metals, so this *residuum*-storing capability of the creature was never known. Even when the creatures came into contact with the adventurers exploring deeper into the places where the rust monsters laired, very few adventurers whose magic gear was destroyed and eaten by the creatures remained in the area long enough to learn of this aspect, assuming they survived the encounters.

Individuals with more ambition than intellect or common sense, upon learning about the rust monster's ability to store *residuum* from consumed magic

metal, schemed for ways to take advantage of this ability. They reasoned that if unwanted magic items are sold for a fraction of what it cost to create them, and if the *residuum* recovered from the Disenchant Magic Item ritual is similarly just a fraction of the value of the item, then feeding unwanted or unusable magic items to rust monsters could be a lucrative business.

However, these schemers failed to realize several problems with such plans. Keeping rust monsters in captivity required a great deal of capital and attention—so many escaped captivity and did extensive damage that the cost greatly outweighed the potential gain. The sharp claws of the rust monster can dig through all but the hardest natural materials, and obviously any sort of metal restraints are useless in holding the creatures.

Rust monsters in captivity failed to breed and thrive as they do in their natural environs. To get the *residuum* from the creature, the rust monster must be cut open, thus killing the beast, and they turned out to be somehow resistant to efforts made to bring them back to life. Worst of all, the amount of time needed for the rust monster to digest the magic metal and leave the *residuum* varied. After a magic metal object

is consumed, the creature must fully digest the rusted metal. Cutting open the creature too soon might reveal just useless, partially digested rusted metal. However, if the *residuum* was left inside the creature too long, it began to be absorbed by the creature—sometimes to the point that less *residuum* is present than would have been gained through a simple Disenchant Magic Item ritual.

PHYSIOLOGY AND HABITAT

More frequent contact with the beast called the rust monster has moved what is known about the beast past the realm of myth into an area of scientific inquiry and study. This study has revealed much about the creature, although what has been learned has made the creature no less wondrous—and no less feared and hated for the destruction it can bring to civilization.

NATURAL HABITAT AND SOCIAL STRUCTURE

The most conducive habitat for the rust monster is a sheltered underground area rich in naturally occurring metallic ore. In such an environment, a colony of 12 to 40 rust monsters can survive for months, or even years, without the need to uproot themselves in search of additional sustenance. Such an area provides plenty of nourishment, while at the same time requiring the colony of rust monsters to work together to find and harvest their required food, protect themselves, raise their young, and survive.

In such an environment, generally three to five adult males work in cooperation with five to seven

adult females in the creation of the colony. Each female, depending on the stability of the colony and the abundance of food, can rear from one to six offspring at a time. The males and nonpregnant adult females labor at digging through the stone to find the metallic ore needed to survive. Ore found is brought back to the colony and shared. The newborn rust monster lacks sufficient secretion from its rust sac to oxidize its own meals, so it relies on others to prepare its food for consumption.

Once the needs of the pregnant females and young in the colony are met, the adults consume the rest of the food. If there is not enough food to meet the nutritional needs of the adult population, the adults generally fight over the food. Generally these fights are not to the death, although in this way the weaker of the rust monsters are generally forced to leave the colony and find their own food sources elsewhere. However, the rust monster is by no means any more intelligent than any other beast. This social organization that serves a rust monster colony is instinctual rather than contractual.

Colonies are formed when one dominant male or female finds an abundance of ore and allows other rust monsters to join it in working the ore. In this way, the creatures are not unlike the dwarves that revile them so. In the absence of abundant ore, the rust monsters—whether male or female—tend to be solitary creatures searching for enough food to survive.

Oddly enough, experts on the rust monster believe that while other species thrive in an environment where food is overabundant, the rust monsters' social structure breaks down when in such conditions. Two primary reasons exist for this. First, when an overabundance of food is present, the rust monster tends

HOW MUCH IS ENOUGH?

DMs who want to integrate *residuum* found inside a rust monster into an encounter, adventure, or even campaign can use the information in the rust monster nightmare below to help figure out how much is enough. (See page 124 of the *Dungeon Master's Guide* for treasure guidelines, also.)

to reproduce too quickly and prolifically, and soon the colony breaks down with too many young.

The other reason has to do with the chemical reaction that takes place in a male rust monster when it digests too much metal, or metal that is too pure. A rust monster partaking of too much metal or too refined a metal has a reaction not unlike a humanoid addicted to drugs or alcohol. The creature craves more of the metal, becomes unwilling to share the metal with other rust monsters, and finally becomes violent if it cannot have as much metal as it needs. This veritable addiction can lead to a breakdown of the colony's delicately balanced social structure. Even something such as a typical party of adventurers, with

all their worked metal gear, can disrupt a thriving colony. As soon as the males get a taste of the iron or steel weapons and armor, the gold or platinum coins, and the silver jewelry, the violent reaction is triggered and the colony falls apart from the inside.

PHYSIOLOGY AND DIET

Whatever the origins of the rust monster, none can dispute that the creature's main source of nourishment is rusted metallic material. Experts on the creature differ on whether the process by which the rust monster survives is natural or magical, but none deny that it is fascinating.

The process begins in a gland located in the rust monster's throat called the rust sac. This gland produces an oxidizing substance that, when it comes into contact with metal, rusts it practically immediately. Ducts lead from the rust sac into the creature's mouth, which mean that the creature's entire mouth—including the teeth and tongue—are awash in this substance. As a result, a rust monster's bite, in addition to being very powerful, delivers enough of the oxidizing substance to be harmful to any metallic substances, including armor and weapons.

Ducts also lead from the rust sac into the blood of the creature. While the amount of the oxidizing substance in the blood is less than what is in the mouth, enough is present in the blood to pose a risk to weapons that draw blood when they strike the rust monster.

Interestingly, experiments have shown that in the absence of metallic substances, rust monsters seem partial to mammalian blood as a food source. Many experts believe that rust monsters are therefore naturally susceptible to a form of vampirism. More preposterous theories claim that mammalian blood contains metal! It is undisputable, however, that when no other natural form of metal is present, but an abundance of blood is nearby, the rust monster is drawn to the blood as if it was metallic.

The most basic staple of the rust monster's diet is unworked metallic ore. The rust monster can sense such ore if within several hundred feet of it, even through solid rock. Using its powerful claws for digging, the creature can slowly and methodically tunnel through solid rock until it reaches the ore. Its beaklike mouth can clear rock away from the metallic substance it is seeking. After using the oxidizing substance in its saliva to rust the ore, the creature's

large, flat, platelike teeth grind the rusted metal into digestible flakes.

The rust flakes travel down the throat and into the stomach, as with other mammalian creatures. In addition to other glands that supply the stomach with substances for digestion, another gland produces a substance with the sole purpose of turning the rusted material into nutrients that the rust monster's body can use.

In the course of a normal meal, the rust monster consumes a large amount of rock. This rocky material that is swallowed with the metal is held in the stomach for a short time, and it assists in the processing and digesting of the metal into the nutrients used by the body. Some also believe that small amounts of the rock are used in the creation of the bony plates that cover the rust monster's body. Undigested and unused rock material is eliminated from the body as normal waste.

As was mentioned previously, the rust monster's physiology is designed best for the consumption and processing of naturally occurring metallic ore. The baser metals, such as iron and copper, are sufficient for the survival and prosperity of the creature. More precious metals, particularly gold and platinum, can sustain a rust monster, although they are of less nutritional value: this is akin to a child preferring sweets even though onions and potatoes are better for their growth and development. However, the rust monster does not have a mother that can enforce the proper diet with a stern word or a hickory switch.

Where the rust monster is truly at risk, however, is in the consumption of metal that has been worked. The smelting process removes the impurities from the ore, making it highly concentrated. Whereas they normally consume ore mixed with dirt, rock,

and other substances found in the earth, smelted metal is quite pure. Imagine if a man raised drinking watered-down grog or wine suddenly found the finest elven wine or the strongest dwarven ale at his table. The difference would be not only noticeable, but also quite deleterious indeed!

And so it is similar with the rust monster and worked metal. The unadulterated strength of the metal affects the rust monster's system and brings about changes in the creature. The powerful rush of nutrients into the rust monster's system overpowers the creature's social instincts. It craves the more concentrated metal to the point that it is willing to destroy its own kind to get it. While just one instance of exposure to worked metal can cause a creature's behavior to change slightly, it takes repeated and prolonged ingestion of such metal to cause the creature to truly lose its way. But as we will see, the imbibing of worked metal is not the only thing that can cause a rust monster to change in truly dramatic ways.

INSTANT TRANSFORMATIONS

While the ability of the rust monster to instantly oxidize and consume metal is totally amazing by itself, what happens when it eats enchanted metal is nothing short of miraculous. As wizards and sages have known for years, *residuum* is an element left behind when a magic item is disenchanting. That *residuum* can thereafter be used to fuel a variety of rituals.

Through a purely coincidental encounter between a rust monster and an enraged barbarian who lost his magic executioner's axe to the beast, it was learned that the rust monster has a special organ dubbed the *residuum pouch*. This small sac is connected to the digestive track of the rust monster between the stomach and the intestines. After the magic metal is

digested, the *residuum* is diverted from the intestines to the *residuum pouch*. Once there, the *residuum* sits for a period of time. During this time, which can be anywhere from a few minutes to several weeks, the *residuum* is absorbed into the rust monster's body through ducts from the *residuum pouch* back into the intestines.

The rust monster nightmare still needs to consume rusted metal to survive, but it can also gain sustenance from magic. For example, a wizard who uses a magic orb to attack the rust monster nightmare might find that some of the orb's power is absorbed, causing the orb to decay, even though the orb never makes contact with the creature. An item might even be rendered useless if it decays enough. The rust monster nightmare can then consume the magic item, just as it could eat a rusted metal item.

The speed of the transformation between rust monster and rust monster nightmare is astounding. Some experts believe that the long antennae and pluming tail of the rust monster, which is sensitive to metal, are magic conduits that are altered by the existence of *residuum* in them. Hence, an almost ritual-like occurrence takes place in the antennae and tail when those appendages are infused with *residuum*, leading to inexplicable and devastating new powers, as well as a rapid increase in size and strength.

Some of the more imaginative thinkers on the subject of the rust monster theorize that if the magical properties of the antennae and tail can react in such a way when exposed to *residuum*, it is likely that similar transformations could take place when exposed to other forces, such as highly magnetized metal, to different chemical compounds, or even to strong emotions.

INSECTOID OR MAMMALIAN?

Many early observers of the rust monster mistakenly assumed the creature was insectoid. This was certainly an understandable mistake. The creature's hard, seemingly chitinous covering, the jointed and armored legs, and the large feathery antennae all indicated a physiology that resembled a variety of insects. (One early description of the creature was "the metal mantis.")

Closer examination of the creature, in concert with the first true vivisections of the beast, revealed otherwise. The internal organs, including one heart, one stomach, one liver, two kidneys, and most of the other organs associated with mammals, were all present. However, what makes the creature the unique specimen that it is are the extra organs it possesses.

One intriguing way in which the creature resembles some mammals is a peculiar aspect of the female's reproductive system. When an embryo

in a female rust monster is fertilized, the embryo doesn't immediately implant in the uterine wall. This phenomenon, known as embryonic diapause, is present in a few other species, particularly those that need to go for long periods of time without the required nutrition.

Essentially, the female rust monster can carry between one and eight fertilized embryos without truly being pregnant. The females can stay in that condition for up to 2 years. When the female's body is in a state where it is healthy enough to support the young, then the embryos implant and begin to gestate. This mechanism that ensures the female is in a situation to support its young is another hurdle to rust monster domestication. The circumstances that are necessary to allow the embryos to implant are almost impossible to maintain in a nonnatural habitat. Female rust monsters in captivity very rarely give birth, as intrepid would-be rust monster breeders continue to learn at the cost of their fortunes.

KNOWLEDGE OF RUST MONSTER

ARCANA

DC 10: Rust monsters are creatures that have the ability to rust through metal objects and then eat them.

DC 15: A rust monster can rust metal with its bite. The blood of the creature also contains a rusting substance, so even damaging them with metal can leave metal weapons at risk.

DC 20: Rust monsters that eat magic metal can store *residuum*, a substance used in magical rituals, in their bodies. This *residuum* can be harvested if the creature is killed when the metal has digested but before the *residuum* is absorbed.

DUNGEONEERING

DC 15: A rust monster lair is generally recognizable by thin, winding tunnels that follow precisely the course of the vein of metal through the ground.

DC 20: A lair of a rust monster colony can be a very dangerous place, because a swarm of young rust monsters could be encountered, and one altered rust monster might also be present, such as a rust monster lodestone.

HISTORY

DC 15: Unscrupulous leaders in wars both above and below the ground have used rust monsters as weapons. In many cases, the rust monsters did more damage to their keepers than to the enemy.

DC 20: Many nations and cities have obscure laws on the books making it illegal to purchase, sell, raise, or even possess a living rust monster.

NATURE

DC 15: Rust monsters are normally found far below the earth, in places where there is an abundance of naturally occurring metallic ore.

DC 20: Rust monsters are very hard to domesticate, although they are sometimes used as guards by creatures who do not normally use a great deal of metal, such as fey or lizardfolk.

ALCHEMICAL ITEMS AND POTIONS

The strange physiology of the rust monster means that some of its body parts, including its tail, antennae, rust sac, and residuum pouch, can be used in the creation of alchemical items and magic items such as potions. Since the rust monster is such a rare specimen, these items of power are equally rare and difficult to make.

RUST BOMB

Level: 5

Category: Volatile

Time: 1 hour

Component Cost: See below.

Market Price: 200 gp

Key Skill: Arcana or Nature (no check)

The liquid distilled from the rust monster's rust sac spreads from the shattered glass vial across the armor of a foe, leaving gaps in its defenses.

Rust Bomb

Level 5+

On impact, this glass vial breaks, releasing a rusting agent that begins to deteriorate metal armor.

Lvl 5	50 gp	Lvl 20	5,000 gp
Lvl 10	200 gp	Lvl 25	25,000 gp
Lvl 15	1,000 gp	Lvl 30	125,000 gp

Alchemical Item

Power (Consumable): Standard Action. Make an attack:

Ranged 5/10; +8 vs. Reflex; on a hit, a target wearing metal armor or that has a metallic body takes a -1 penalty to AC until the end of the encounter.

Level 10: +13 vs. Reflex

Level 15: +18 vs. Reflex.

Level 20: +23 vs. Reflex.

Level 25: +28 vs. Reflex.

Level 30: +33 vs. Reflex.

CORROSIVE OIL

Level: 3

Category: Oil

Time: 15 minutes

Component Cost: See below.

Market Price: 400 gp

Key Skill: Arcana or Nature (no check)

The oil made from the blood of a rust monster can coat any nonmetallic surface. Any metallic weapon that comes into contact with the coated surface begins to lose its effectiveness.

Corrosive Oil

Level 3+

Nonmetallic armor coated with this oil has the ability to lessen the effectiveness of metallic weapons that strike it.

Lvl 3	30 gp	Lvl 18	3,400 gp
Lvl 8	125 gp	Lvl 23	17,000 gp
Lvl 13	650 gp	Lvl 28	85,000 gp

Alchemical Item

Power (Consumable): Standard Action. Apply corrosive oil to a set of nonmetallic armor that you wear. The next time a creature hits you with a metallic weapon, make the following attack: +6 vs. Reflex; on a hit, the attacker takes a -1 penalty to attack rolls with that weapon and a -2 penalty to damage rolls with that weapon (save ends both). *Aftereffect:* The attacker takes a -2 penalty to damage rolls made with that weapon (save ends).

Level 8: +11 vs. Reflex; -3 penalty to damage rolls.

Level 13: +16 vs. Reflex; -5 penalty to damage rolls.

Level 18: +21 vs. Reflex; -6 penalty to damage rolls.

Level 23: +26 vs. Reflex; -8 penalty to damage rolls.

Level 28: +31 vs. Reflex; -9 penalty to damage rolls.

Level: 3+

Category: Curative

Time: 15 minutes

Component Cost: See below

Market Price: 30 gp

Key Skill: Arcana or Nature (no check)

When dried, powdered, and prepared appropriately, a rust monster's antennae can produce a deep red powder that enables a creature to resist the effects of fear.

Bravery Powder

Level 8+

This powder, made from the antennae of a rust monster terror, helps fortify the spirit against fear effects.

Lvl 3	30 gp	Lvl 18	3,400 gp
Lvl 8	125 gp	Lvl 23	17,000 gp
Lvl 13	650 gp	Lvl 28	85,000 gp

Power (Consumable): Minor Action. You or an adjacent ally can make a saving throw against a fear effect. The source of the effect must be 6th level or lower.

Level 8: The source of the effect must be 11th level or lower.

Level 13: The source of the effect must be 16th level or lower.

Level 18: The source of the effect must be 21st level or lower.

Level 23: The source of the effect must be 26th level or lower.

Level 28: The source of the effect must be 31st level or lower.

NEW RUST MONSTERS

The normal form of the creature is the average rust monster, although the young can be dangerous when they attack in a swarm. The text below describes other types of rust monsters that are created when the normal beasts are exposed to large amounts of certain substances. These creatures generally look exactly like a normal rust monster, but the absorption of certain substances or even emotions alters the powers that the creature possesses.

RUST MONSTER LODESTONE

The rust monster lodestone is created when a standard rust monster consumes an unusually large amount of magnetized metal. When this transformation takes place, the creature loses its ability to secrete the metal rusting enzymes from its rust sac. It therefore loses the ability to rust metal, although it can still consume it. However, its inherent magnetism allows it to manipulate magnetic waves, thus giving it the ability to move and damage creatures from a distance.

Rust Monster Lodestone	Level 8 Controller	
Medium natural beast	XP 350	
Initiative +7	Senses Perception +8; low-light vision	
Repulsion aura 2; enemies treat all squares within the aura as difficult terrain.		
HP 86; Bloodied 43		
AC 22; Fortitude 18, Reflex 21, Will 22		
Speed 6		
⬇ Bite (standard; at-will)		
+13 vs. AC; 1d10 + 6 damage, and target slides 1 square, or 2 squares if the target is wearing heavy armor.		
⬇ Dissolve Metal (standard; encounter) ⬆ Reliable		
Targets a creature wearing or wielding a rusting magic item of 10th level or lower or any nonmagic rusting item; +12 vs. Reflex; the rusting item is destroyed.		
⬇ Repulsing Strike (standard; recharge ⏏ ⏏ ⏏)		
+12 vs. Fortitude; 1d10 + 6 damage, and target slides 3 squares, or 6 squares if the target is wearing heavy armor.		
⚔ Lodestone Assault (standard; recharge when first bloodied)		
Ranged 5; the rust monster lodestone slides an ally up to 5 squares, then that ally makes a melee basic attack with a +2 power bonus to the attack roll.		
⚔ Lodestone Pulse (standard; at-will)		
Ranged 5; +12 vs. Fortitude; 1d6 + 6 damage, and the target is slowed until the end of the rust monster lodestone's next turn. <i>Aftereffect:</i> If the target is wearing heavy armor, it is slowed (save ends).		
⚡ Magnetic Burst (standard; encounter)		
Area burst 2 within 10; +12 vs. Fortitude; 2d8 + 5 damage, plus an additional 4 damage if the target is wearing heavy armor, and the target is knocked prone.		
Alignment Unaligned	Languages –	
Str 8 (+3)	Dex 16 (+7)	Wis 18 (+8)
Con 14 (+6)	Int 2 (+0)	Cha 12 (+5)

RUST MONSTER LODESTONE TACTICS

The rust monster lodestone is generally found as a dominant male in a large rust monster colony. Although the lodestone cannot actually cause a weapon to rust, it can consume an already rusted piece of metal. The lodestone uses its control over magnetic forces to manipulate living creatures, whether enemies or allied rust monsters.

RUST MONSTER TERROR

The rust monster terror mutates from a normal rust monster because of exposure to intense fear and panic absorbed from humanoid creatures that encounter it. The psychic energy released by the terrified emotions is brought into the creature through

Rust Monster Terror	Level 9 Soldier	
Medium natural beast	XP 400	
Initiative +6	Senses Perception +5; low-light vision	
HP 94; Bloodied 47		
AC 25; Fortitude 21, Reflex 19, Will 19		
Speed 6		
⬆ Bite (standard; at-will)		
+16 vs. AC; 1d10 + 5 damage, and the target is marked until the end of the rust monster terror's next turn.		
⬇ Dissolve Metal (standard; encounter) ⬆ Reliable		
Targets a creature wearing or wielding a rusting magic item of 10th level or lower or any nonmagic rusting item; +12 vs. Reflex; the rusting item is destroyed.		
⚡ Terror Burst (minor; recharge ⓂⓂⓂ) ⬆ Fear		
Burst 1; +12 vs. Will; targets hit by the attack take a -2 penalty to attack rolls and are immobilized (save ends).		
Fear Reverberation		
If targeted with a fear power, the attack automatically misses, and both the rust monster terror and the attacker take ongoing 5 psychic damage (save ends).		
Residium Recovery		
A rust monster terror consumes any item it destroys. The <i>residium</i> from any magic items the creature has destroyed can be retrieved from its stomach. The <i>residium</i> is worth the market value of the item (not one-fifth the value).		
Alignment Unaligned	Languages –	
Str 16 (+7)	Dex 10 (+4)	Wis 12 (+5)
Con 14 (+6)	Int 2 (+0)	Cha 12 (+5)

their sensitive antennae. The energy can then be used by the rust monster terror to attack other creatures. This change in the creature renders the rust sac useless, but the creature can still consume and destroy equipment rusted by other rust monsters.

RUST MONSTER TERROR TACTICS

A rust monster terror acts as a guard of thriving rust monster colonies. While it cannot rust metal due to changes in their rust sac, it can consume rusted metal as easily as a normal rust monster. The terror uses *terror burst* when surrounded by strong foes. Assuming there is no nearby rusted metal to consume, a rust monster terror bites its enemies and attempts to keep them away from the females and the young.

RUST MONSTER NIGHTMARE

Imagine if a normal rust monster found its way into the armory of a long-abandoned dwarven stronghold—one that held numerous and powerful magic weapons, armor, and shield, and possibly even an artifact! Through constant ingestion and absorption of the highly enchanted metals of such a place, it is theoretically possible for the creature to mutate into an epic-level threat.

Such a creature could certainly gain a reputation as being a powerful force, to the point where legends might evolve, leading civilized folks to believe that a powerful dragon or demon was lairing there. The creature might even gain sentience, possibly collecting an army of followers and worshipers who revere the great beast for its power, size, and capabilities.

RUST MONSTER NIGHTMARE TACTICS

A rust monster nightmare targets creatures wearing large amounts of metal, as do most of the normal versions of the creature. It uses *dweomer feedback* as early in a battle as possible, then wades into melee range, hoping to maximize a *psychic trap*. It then uses *consumptive focus* against an armored target, or *bite* against a lightly armored enemy, and *dissolve item* if a creature already has a decaying item.

SAMPLE ENCOUNTERS

Neither the rust monsters nor their altered cousins are naturally violent or aggressive. However, their near-constant craving to consume metallic substances makes them seem like they are inherently violent when they are in the presence of metal. In their natural habitats, they are most often encoun-

Rust Monster Nightmare		Level 24 Solo Controller
Huge natural beast		XP 30,250
Initiative +15	Senses Perception +21; blindsight 20	
Repulsion aura 4; enemies treat all squares within the aura as difficult terrain.		
HP 888; Bloodied 444		
AC 38; Fortitude 33, Reflex 37, Will 36		
Resist psychic 30		
Saving Throws +5		
Speed 8, teleport 6		
Action Points 2		
Ⓢ Bite (standard; at-will)		⚡ Psychic Trap (standard; recharge when first bloodied)
Reach 2; +28 vs. AC; 3d8 + 6 damage, and if the target is wearing magic armor, the armor starts decaying; the wearer takes a -1 penalty to AC until the end of encounter. This penalty is cumulative, to a maximum -5.		Close blast 5; +26 vs. Will; 2d12 + 6 psychic damage, and the target is immobilized until the end of the rust monster nightmare's next turn. <i>Miss:</i> Half damage, and the target is slowed until the end of the rust monster nightmare's next turn.
Ⓢ Consumptive Focus (standard; at-will)		Extradimensional Lock (immediate interrupt, when an enemy teleports into or out of a square adjacent to the rust monster nightmare; at-will)
Ranged 5; +27 vs. Reflex; 2d12 + 6 psychic damage, and if the target is wearing magic armor, the armor starts decaying; the wearer takes a -1 penalty to AC until the end of encounter. This penalty is cumulative, to a maximum -5.		Targets the triggering creature; +27 vs. Will; the teleport fails and the rust monster gains 20 temporary hit points.
⚡ Dissolve Item (minor 1/turn; recharge ☒ ☒) F Reliable		Magic Consumption (when the rust monster nightmare is hit by an attack that uses a magic implement or weapon; at-will)
Targets a creature wearing or wielding a decaying magic item of 30th level or lower; +28 vs. Reflex; the decaying magic item is destroyed.		The implement or weapon used in the triggering attack begins decaying; the wielder of the weapon takes a -1 penalty to damage rolls with that weapon until the end of the encounter. This penalty is cumulative, to a maximum of -5.
⚡ Nightmare's Flurry (standard; at-will)		Residuum Recovery
The rust monster nightmare shifts 4 squares by leaping and makes four melee or ranged basic attacks.		A rust monster nightmare consumes any item it destroys. The <i>residuum</i> from any magic items the creature has destroyed can be retrieved from its stomach. The <i>residuum</i> is worth the market value of the item (not one-fifth the value).
⚡ Dweomer Feedback (standard; recharge ☒ ☒)		Alignment Unaligned
Ranged 10; +26 vs. Fortitude; 3d12 + 6 damage, and the target is stunned (save ends). <i>First Failed Saving Throw:</i> The target is unconscious (save ends). The rust monster nightmare causes the magical possession of the target to exude painful vibrations.		Languages – (telepathy)

		Cha 12 (+13)

tered when they are either searching for food or protecting their lairs. When they are encountered outside of their natural habitat, they are most often being used as guards or attack beasts.

RUST MONSTER LAIR

Encounter Level 8 (1,750 XP)

The lair represented by the map shows what adventurers might find when they come upon a portion of a rust monster colony. In this particular lair, a female

rust monster has recently given birth to a swarm of rust monster young. This portion of the colony is led by a rust monster lodestone. Four normal rust monsters are bringing pieces of rusted metallic ore to the swarm to give it nourishment.

SETUP

Rust monster lodestone (L)

Young rust monster swarm (S)

4 rust monsters (R)

LAIR FEATURES

Colonies with pregnant females or abundant young often contain a large amount of rusted material. These piles of rusted metal could be designated as difficult terrain. To make the encounter more challenging, the DM might make the piles of rusted metal into hazardous terrain. In such a case, creatures other than the rust monsters entering the terrain might take an attack (+8 vs. Reflex; on a hit, the target takes 1d8 damage and ongoing 5 poison damage). Alternatively, PCs cut by the rusted metal could contract a disease.

In addition, a lair containing these metallic piles and a rust monster lodestone could be spiced up by allowing the lodestone, as a minor action, to move one or more of the piles to new squares, forcing the PCs to deal with difficult terrain that can be manipulated by the enemy.

Rusty Paralysis

Level 8 Disease

This disease affects those cut by rusty metal. The victim gets slowly weaker, and in the final stages the victim becomes paralyzed.

Attack: +11 vs. Fortitude

Endurance improve DC 19, maintain DC 14, worsen DC 13 or lower

The target is cured. **Initial Effect** The target loses one healing surge that it cannot regain until cured. **Final State** The target is restrained.

RUST MONSTER GUARDS (SPRIGGAN LAIR)

Encounter Level 7 (1,650 XP)

The area represented by the map shows how other creatures might use rust monsters as guards. In this case, a group of spriggans (*Monster Manual 2*, page 192) is using two rust monsters as the first line of defense for their underground lair.

SETUP

Spriggan witherer (W)
2 spriggan giant souls (S)
2 rust monsters (R)
False floor pit (T)

LAIR FEATURES

A thin metal plate covering a pit might be made a threat if the rust monster was allowed to rust the plate without eating it, thus making it weak and susceptible to breaking when a certain threshold of weight was placed on it. Alternatively, the metal plate could be left whole, but the rust monsters are released when PCs step upon it. When the rust monsters rush forward to attack, they bite the metal plate instead of the PCs, thus triggering the trap while the PCs are in a precarious situation.

The most difficult problem faced by those using rust monsters as guards is keeping them in place, since they normally range far and wide until they come upon a source of metal. The spriggans have devised a method to keep the rust monsters in the area they are supposed to guard. The tricky fey creatures spread fine iron shavings in an area, such as in thick grass or buried under a thin layer of soil. The rust monsters can sense an abundance of metal in the area, but they can find only the tiniest pieces of metal through great effort. As long as no other source of metal is nearby, the rust monster might spend weeks of painstaking labor as they find, rust, and devour the shavings. The genius of this method is that it keeps the rust monsters occupied until a typical adventuring party approaches. The adventurers generally wear or carry so much metal that the rust monsters are immediately drawn to them and away from the metal shavings that held them in their guard areas.

The Ecology of the

RUST MONSTER

When magic and metal determine one's prowess, a beast capable of crumbling even artifacts with its merest touch holds the power to ruin armies and shatter kingdoms. Such is the might of the universally dreaded rust monster.

As the cost required to imbue even a simple weapon with magical power greatly outweighs that necessary to return life to the dead, many warriors consider tangling with rust monsters a fate worse than death. Ironically, rust monsters become more dangerous as adventurers become more powerful. As adventurers increase in wealth and experience they possess much more to lose—expensive weapons, magic armor, wonders of sorcerous might, and artifacts from the planes and beyond. While adven-

turing neophytes might see rust monsters as nothing more than nuisances, hardened veterans speak of these pervasive beasts with a specially held dread—for ruin might be a mere antenna swipe away.

HISTORY OF THE RUST MONSTER

Rust monsters are woefully under-studied, as most adventurers would rather avoid the beasts than observe them. Even more frustrating, the creatures' peculiar physiology resists dissection by metal scalpels, and such dull-witted beasts have no records or stories of their own. Among the many fanciful theories proposed to explain the origin of rust monsters, scholars favor two.

"It's better to wear out than to rust out."
—Richard Chamberland

The majority view holds that rust monsters originated on the harsh plane of Acheron, having carved out a successful niche there. With an infinite number of metal cubes, rust monsters could feast freely on the essence of the plane itself. Some scholars believe that Acheron's crashing cubes were not always the rusted and pitted wrecks seen today, their pristine geometries eroded over the eons by rust monsters' insatiable hunger.

On Acheron, the native bladeling tribes treat rust monsters with respect and dread. The jagged pages of bladeling holy scriptures predict an apocalypse ensuing when these marauding aberrations bore a planar hole into Mechanus and rust away several key gears, bringing the multiverse to a grinding cataclysmic halt. Lending credence to this belief, some of the best-traveled planar explorers tell tales of planet-sized cubes on Acheron's farthest frontiers, skeletal hulks reduced to little more than rusted frames and home to populations of rust monsters that dwarf the number residing on all

KNOWLEDGE OF THE RUST MONSTER

The following table shows the results of a Knowledge (dungeoneering) check as it relates to rust monsters. Underdark explorers, those who study aberrations, and most veteran adventurers are likely to possess this information.

Knowledge (dungeoneering)

DC Result

- | | |
|----|--|
| 10 | Rust monsters are dog-sized insectal creatures best known for their mothlike antennae, the touch of which corrodes metallic objects. |
| 15 | A rust monster's carapace destroys metal—even rare minerals like adamantite—just as its antennae do. Wood, stone, and nonmetallic substances are unaffected by these creatures' touch. |
| 20 | While dull-witted, rust monsters are tenacious. They can smell metal at great distances and relentlessly pursue their meals, favoring rare and valuable materials to crude metals. |
| 25 | Although they are more resistant than normal metal wares, magic weapons and armor are also vulnerable to a rust monster's corrosive powers. |

the Material Plane. Whether this doomsday paranoia is founded or not, rust monsters seem to have fared quite well on the Material Plane and now feast upon its metals as ravenously as on Acheron's.

A divergent view of the origin of rust monsters holds that they were specifically bred to prevent the rise of technol-

ogy. Some scholars believe an unnamed entity who once ruled several demiplanes far from the Great Wheel pronounced technology and technological creatures to be inimical to magic and the existing planar order. This intelligence—allegedly an amalgam of sentient plant life—created rust monsters from tiny planar parasites in the hopes of eliminating the

TALES OF RUST AND DOOM

From humble beginnings, rust monsters have been plaguing D&D players (and pleasing DMs) for nearly three decades. Ed Greenwood even presented his take on the rust monster twenty-two years ago, in *DRAGON* #88, with the first "Ecology of the Rust Monster." Presented here are a few industry insiders' reminiscences regarding D&D's romance with rust.

"There isn't much to relate regarding the rust monster, truth be told. When I picked up a bag of plastic monsters made in Hong Kong at the local dime store to add to the sand table array—we were playing Chainmail Fantasy Supplement miniatures at a 1:1 scale, there was the figurine that looked rather like a lobster with a propeller on its tail.

"As we assigned names and stats to these critters, bulette and owl bear for instance, nothing very fearsome came to mind regarding the one with the projecting feelers. Then inspiration struck me. It was a "rust monster," a thing whose touch turned ferrous metals to ferrous oxide, even magical steel armor or enchanted iron or steel weapons.

"The players soon learned to hit one with spells and arrows so as to slay it at a distance. When one appeared in the D&D game, usually in a dungeon setting, there was great haste to remove from its vicinity if there was no sure and quick means of destroying it at hand.

"Sadly, although I do recall that there was an amusing incident or two involving a rust monster in the early days of dungeon crawling, the details are lost to my memory."

—Gary Gygax

metal fundamental to many technologies. This rumor is supported in several ancient poetic sagas and songs, especially among nature-loving races and societies. Supposedly, a large concern of adventurers once sought to track down the entity responsible for

the genesis of rust monsters. All they found, though, was a land reduced to a crumbled ruin—all vitality sapped from an entire realm collapsed in upon itself.

Despite their base intelligence and manner, rust monsters have come to be potent symbols. Nihilistic groups like the Doomguard favor these beasts as manifestations of the inherent weakness of all matter, while anarchists, freedom fighters, and slaves across the planes cherish the rust monster as a herald signaling the end of shackles and tyranny.

PHYSIOLOGY OF THE RUST MONSTER

Aberrant creatures, rust monsters appear to be equal parts overgrown crustacean and impossibly large insect. While most grow to the size of powerful mastiffs or even small ponies, specimens comparable to rhinoceroses in size, weight, and armor thickness are sometimes found in metal-rich areas.

The most noteworthy part of a rust monster is its antennae. Covered with minuscule, stiff hairs, these antennae tie to a number of complex capillary tubes that stretch into the stomach. Rust monsters breathe in carbon dioxide and convert it into oxygen and other caustic gases. These gases are pumped into the small hairs where, upon contact with metal, the gases quickly initiate an oxidation reaction that corrodes the metal. The name "rust monster" is something of a misnomer, though, as they corrode any metal, not just iron; iron turns into rust, while other metals merely become coarse, worthless dust. A rust monster's carapace is covered in the same hairs as the antennae, corroding all metal coming into contact with its body. Only the boney flanges of a rust monster's tail are devoid of these hairs, a trait useful in the creatures' mating process.

Rust monsters are natural trackers, capable of seeking out an armored opponent as easily as a vein of

valuable metal ore. When around bloodshed, the scent of iron in the blood drives hungry rust monsters into a frenzy, and starved specimens have been known to viciously attack wounded creatures.

A rust monster's tail is used for stability and breathing, with a gill-like structure that helps take in—along with the mouth and nostrils—enough carbon dioxide to produce the large supplies of oxygen they need to corrode metal. Males possess larger tails than females, which in addition to breathing they use to attract the attention of potential mates.

Rust monsters hatch from spherical, iron-colored eggs. After a brief pregnancy, a mother lays her clutch of eight to twelve sticky, melon-sized eggs into deposits of metal rich rock. Although the eggs require no special attention, both of the parents stay nearby to ward away any hunters (particularly umber hulks, which view all rust monsters—but particularly their young—as delicacies). After approximately a month the eggs hatch, each spilling out a tiny larval rust monster about the length of a man's forearm. These young have no appendages and look like nothing more than bloated, brownish maggots with moist antennae approximately a foot long. These antennae possess the same corrosive effects as an adult rust monster's, and over the next two years grow in size, along with legs, a bony tail, and a hardened carapace.

Some adventurers hunt juvenile rust monsters as they are more easily handled and turned to specific purposes than adults.

Being aberrations, mutation is natural to rust monsters, and several regional variants exist. Shaggy, blue-white frostfell rust monsters prowl some arctic regions, supplementing oxidation with extreme cold to shatter metals. Moss rust monsters dwell in damp rainforests and swamps, their infected hides riddled with dripping, mossy spores. Dun and khaki-hued waste rust monsters roam desert landscapes, reducing metal they encounter into sand instead of rust. Legends even say the al-Khalid desert was actually once the great sprawling city of a learned and terrible race that raised buildings made of steel, but a horde of rust monsters reduced it to sand in one fell night.

A few unconfirmed theories imply that rust monsters are the larval stage of some other creature. With little evidence, such theories propose obvious links between rust monsters and destructive rust dragons (see page 186 of the *Draconomicon*) or similarly formed annihilators (see page 79 of

Underdark). Certainly many metals have magical properties, which in concert with aberrations' penchant for mutation could have caused strains of rust monsters to evolve into different creatures. Many sages believe a missing link in a rust dragon's origin might be explained by some connection—or processes—involving rust monsters and metallic dragons. Some studies claim that certain breeds of rust monsters seek out the eggs of metallic dragons and either taint the wyrmling within or transform themselves after feasting on the yolk.

PSYCHOLOGY AND SOCIETY OF RUST MONSTERS

Rust monsters are solitary creatures. Males are uninterested in reproduction until they come into contact with a rare metal—often adamantite or mithral—that triggers psychological changes. The male harvests bits of the metal and scoops uncorroded chunks up with its tail and travels until it finds a female to present it to. Several males often compete to bring a female the largest amounts of the rarest metals, with but one earning her attention. After winning a mate, the male remains with the female until their eggs hatch, then departs. Adventurers with exotic metal items might find themselves harried by waves of hopeful male rust monsters seeking the rare metals they need to impress a female.

Like underground-dwelling locusts, rust monsters wander the depths searching for metal in any form. Upon finding a place with suitable

"The party was a typical [first edition] bunch... exploring a typical [first edition] hackfest of corridors and idols and rabid lizardmen, when they threatened to go off the map of what I had prepared earlier.

"I was being a cheesy bastard that day, so I said: 'There's a corridor there, but you see an iron golem standing in front of it.' You know, nothing challenges players like the sure-TPK encounter, so they were convinced that was the way to go. I tried, but I couldn't talk them out of it. 'There's supposed to be rich treasure in the temple section' got me nowhere. 'Your henchman are refusing to go fight that thing' didn't work either. They were determined.

"Then one of the players... remembered the rust monster they had avoided in a prior session. 'I bet we could capture that thing and kill the iron golem with it!' he says. [So] that's the way it worked out. Of course, the party demanded full experience for the kill. I refused, saying 'The rust monster killed it. It gets the XP.' Like I said, I was a cheesy bastard that day."

—Wolfgang Baur

"The rust monster... makes me recall my first experience with D&D. I don't even know what edition it was, but my best friend lent me the books, and one had a solo adventure in it. Each section had it's own portion of map drawn on graph paper that you could transfer to your own map. I don't recall much of the dungeon save for the map sections with a statue represented by a star and a rust monster. I fell in love with the concept of roleplaying (and with graph paper) that day. I must have run through the solo adventure about fifteen times in a row, each time faithfully redrawing the map... and pretending I didn't know what lay around the corner. To this day rust monsters give me a warm, fuzzy feeling (and stars make me nervous. Designers never mark a statue on a map unless it's trapped or a golem)."

—Amber E. Scott

metallic food sources, a rust monster seeks out a den, preferring cramped, defensible tunnel complexes with several exits useful for evading predators—particularly umber hulks. When injured by metal-using enemies, rust monsters hide in their tunnels, relying on the cramped space to force as much contact with their corrosive carapaces as possible.

Aside from their native Underdark, rust monsters might make their homes in a variety of other regions, eagerly relocating to any environment with an abundant metal food source. While mountains and ore-rich hills attract many of the creatures, the debris and metal-strewn sewers of most cities prove especially hospitable. Many civil officials dread rust monsters and the damage they can do on a community's substructure. Rumors of rust monsters infesting a city's depths often precede retellings of the tale of Haven City, a cliff-side port, half of which supposedly slid onto the sea when rust monsters devoured its underground supports.

Many societies with access to rust monsters seek to domesticate them, hoping to deny their enemies the advantage of metal weaponry (see page 86 of the *Arms and Equipment Guide*). In addition to war, rust monsters serve other uses. Many duergar train rust monsters to track veins of ore or employ the aberrations against enemy fortifications and spells like *wall of iron*. In some societies, enterprising surgeons use rust monster larva to dissolve and eliminate shrapnel, barbed arrowheads and other invasive metal weaponry. Rust monsters are also extremely useful for destroying cursed items, and many adventurers laden with malignant magic items seek them out. Creatures vulnerable to specific metals also often exploit the defensive potential of rust monsters. Noble fey houses and packs of lycanthropes sometimes train rust monsters as guardians, eager to destroy the substances that would do their masters harm. ■

ADVANCED RUST MONSTER

Rust monsters advance exclusively by Hit Dice, growing in size as they age. Such oversized specimens might be found wandering metal-rich regions or as domesticated war beasts.

Like a personification of the rage warriors feel toward rust monsters, o-Akasabi-sama is an ancient and cunning creature. Over the decades this monstrosity has destroyed the weapons and holy katanas of numerous master swordsmen, many of whom committed ritual suicide in disgrace. Now the ghosts of these dishonored warriors haunt the seemingly oblivious rust monster, bitterly goading others into o-Akasabi-sama's corrosive reach.

Rust (Ex) When o-Akasabi-sama makes a successful touch attack with its antennae, it causes the target metal to corrode, falling to pieces and becoming useless immediately. The touch can destroy up to a 10-foot cube of metal instantly. Magic armor and weapons, and other magic items made of metal, must succeed on a DC 28 Reflex save or be dissolved. A metal weapon that deals damage to a rust monster corrodes immediately. Wooden, stone, and other nonmetallic weapons are unaffected.

Spectral Entourage o-Akasabi-sama is attended at all times by at least three rust-colored wraiths that harry well-armed opponents and try to draw them into the rust monster's clutches. With his undead entourage, o-Akasabi-sama is EL 10.

The ecology of the rust monster

by Ed Greenwood

From the *Physiologus Veritas* of the sage Baerdalumi, with notes appended by the author:

The rust monster is a creature of curious, even comical appearance. It waddles with great speed in an ungainly, rocking motion like a raccoon cub, dubbed “gallumphing” by some long-ago observer, and chitters in the fashion of field mice. It is much respected by artisans and fighting-men, however, for its power to cause metal to rust or corrode away by its touch, which corroded metal it then devours and lives on. An example of this respect is the great mercenary general Gulgathas, who has issued standing orders that all smithies in his army’s encampments are to be encircled with a bristling row of sloped, fire-hardened stakes, or propped spears, to discourage the attacks of such creatures.

Rust monsters are non-aggressive, but are both curious and utterly fearless — even, it is said, being immune to magical and psionic influence in their single-minded pursuit of metal.¹ They can smell metal from as far away as a man can make out the features of another man, and are known to prefer ferrous metals over non-ferrous sorts.² Metal clearly visible to the eyes but beyond smell range is apparently nonexistent to rust monsters, and they climb poorly, so the lofty upper reaches of any pole or tree that can withstand their gallumphing charges is a safe haven against the creatures. They have near-infinite patience and perseverance, however, and have been known to wait at the base of such a nearby trove for a month or more.³

Perhaps the best way of battling a rust monster is to crush it in a deadfall, with rolled boulders, or perhaps to trap it in a pit

and strike it from above with rocks and clubs. If one must face it in open-field battle, it can often be successfully disabled by first striking at its antennae and then at its legs, possibly enabling one to escape with prized metal (magical weapon, coins, jewelry) intact. Beware its tail — an ankle-high, lashing sweep of this appendage has knocked many a warrior on his rump, and before he can rise the creature has spun about to beat upon his armor with its antennae, and greedily seek out buckles, weapons, flasks, coffers, and even mirrors buried deep in backpacks!⁴ It has a dexterous, sticky, six-inch-long tongue that it can extend from under its beak to catch up even the smallest flakes of metal or rust.

It is not known what rust monsters originally ate, or why they developed a bony “shell” of armor, an oddly shaped tail, or their strangely specialized antennae, but

since recorded history began these curious beasts have lived in symbiosis with a particular type of bacteria that can apparently coexist with no other species of creature.

These bacteria are found in a rust monster's antennae, stomach, and bloodstream, and have a particular need for metallic ores. They gain energy from the sun (the monster absorbs heat through its body armor and tail), and with this and ingested metallic oxides (more commonly called "rust"), they produce chemical energy (sugar) to power, repair, and nourish for growth both themselves (the bacteria cells) and their host, the rust monster.

The bacteria — a type not yet identified or reproduced by any alchemist — can upon contact with any metal (there are no known exceptions) oxidize the metal,⁵ even if it is inside a rust monster. Thus, anything swallowed by a rust monster, touched by its antennae or tongue, or that draws blood from its innards will rust. A weapon that bounces harmlessly off a rust monster's tail, legs, or bony shell will be unaffected, but any metal weapon that pierces its bony shell and wounds the beast will immediately rust and become useless. Hand-held wooden piercing weapons do not have enough strength to penetrate the shell, and can only harm its eyes and mouth. Wooden clubs are effective weapons against the beast, as are crossbow bolts and arrows.

Rust monsters cannot dig through rock, but can scratch away loose rubble and earth to uncover buried metal (in tombs or caches). They can glean sustenance from all ferrous metallic ores, and often follow the subterranean tunnels of umber hulks, purple worms, and the like, searching for exposed veins of ore in the tunnel walls, or metal treasure in the lairs of various underground creatures. Many an otyugh has dined on a rust monster that tried to root through it to get at treasure lying underneath.

The beasts will often be found exploring mines in search of tools and ironmongery. In one mine north of Mirabar, a standing guard of warriors with wooden weapons is employed to keep lurking rust monsters away from the exposed veins of ore, tools and hoists, and quarried ore. Magic-users are sometimes hired to rid a place of rust monsters by the use of "chain traps." Lengths of old, rusty chain are laid in a large circle in a strategically located cavern or other large area; at the center of the circle sits the magic-user and a few bodyguards with wooden staves. When a rust monster gallumphs up to feast, it ignores the men, the magic-user leisurely throws a fireball at the beast, and its body is rolled aside with the staves. If scavengers (such as hunting dogs or dungeon inhabitants) are not likely to dispose of the remains, the body is painted with a rune or message to warn away other adventurers. Rust monster antennae will continue to rust metal for some time after the creature's death.⁶

Rust monsters wander endlessly in search of food, their bony exterior armor protect-

ing them from most predators. They do not pair for life or choose specific mates, but merely mate with another rust monster when circumstances allow. This prolificacy has kept the curiously unaggressive rust monster from dying out in the face of attacks from humans and natural predators.⁷

Notes

1. A rust monster has only *animal* intelligence, and although it will choose to avoid noise, light, and groups of other living creatures, these cautious habits are swept away when it smells a meal. It will pursue edible metal that it has detected regardless of attacks upon it, potential danger, or attempts to *charm*, *dominate*, or otherwise control its actions by magical or psionic means. (This includes a *repulsion* spell, but a *push* from a magic-user of sufficiently high level would work. A *gust of wind*, however, will not even slow a hungry, ground-hugging rust monster.) The beast's instinctive hunger for metal is too strong for the monster's dim intellect to even notice any other forces attempting to coerce it. In theory, *charm monster* could affect the beast — but only if it is not commanded to do anything that violates its basic nature. (In other words, any command it is given must directly involve getting something to eat, or the *charm* is liable to be broken.) Psionic *domination* of a rust monster is also possible, but it can be troublesome and expensive to maintain control of the monster while forcing it to act against its nature.

2. The sense of smell of a rust monster is apparently linked to magnetism; it increases in effectiveness as the amount and purity of the metal increases. Thus, traces of metal immersed or suspended in liquid, sand, or some forms of clay would escape the rust monster's attention; but rusty nails or tiny shards of metal from a notched or scratched weapon would not. The beast's acute (effective up to 9' distant) sense of smell is believed to be a result of a strain of bacteria unique to rust monsters, which also lends them their rusting ability. Rust monsters can also smell non-ferrous (non-magnetic) metal, but only at a distance of 2".

3. A rust monster can go for as long as two months between one full meal (a suit of plate mail, or equivalent weight in metal) and the next, if it does not expend much energy in the meantime. The monster will unthinkingly try to wait out a target perched in a tree, but won't wait so long that it starves to death. (The unfortunate figure in the tree will probably fall unconscious and drop out of the tree long before this anyway.)

4. If the die roll for the rust monster's chance to hit is one or two digits lower than the number needed for a successful strike with its antennae, there is a chance that it has knocked over an adversary with its tail. Any humanoid standing to the rear of the monster or on either side of it within 5 feet of its body must roll his dexterity or lower on d20 to avoid being knocked down by a sweep of the tail. The rust monster is +4 to

Although [a rust monster] will choose to avoid noise, light, and groups of other living creatures, these cautious habits are swept away when it smells a meal.

hit in the following round against any single target that was knocked down; a miss indicates that the character managed to scramble to his feet and get out of reach of the antennae in time. No character who is knocked down can attack the rust monster in the following round.

5. The bacteria will spread rapidly across the entire surface of any metal object it comes into contact with. A dagger or sword blade or any other relatively small piece of metal will rust completely in 2 segments, and a full suit of plate mail will be corroded within 5 segments after contact. Metal weapons that pierce a rust monster's body will do normal damage on that strike, but will rust immediately afterward. If pulled back from the creature's body and wielded again, the weapon will crumble harmlessly into chunks of rusted metal. The rust monster takes significantly longer to consume the rust — typically 1 round for a buckle, handful of coins, or dagger blade; 2 rounds for a helm; 3 rounds for a shield; 5 rounds for a complete suit of mail; and 6 rounds or longer for horse barding or full coat-of-plate. A rust monster will not stop to eat when it is being attacked, but will begin gobbling its spoils as soon as it perceives that all attacks upon it have ceased.

The DM should judge the effects of a successful rust monster antenna-strike according to the circumstances. If only a certain part of a character's body or weapon is exposed through a doorway or hole, then only that part can be affected. However, the rust does spread across the extent of an entire area of metal; if a character clad in a ring mail jersey strikes at a rust monster through a small opening and his arm is hit by one of the antennae, the *rust* will travel along the jersey and the character will soon lose his shirt. The corrosive action does not "jump" across gaps between two objects or areas of metal. For instance, a character who wears metal leggings and a metal breastplate that aren't in contact with each other will not have all of his armor affected

When forced to fight on open ground, a rust monster will tend to strike at the nearest and largest concentration of ferrous metal.

by the same strike, in the same way that a suit of armor and a helm cannot be rusted at the same time — unless there is a metal-to-metal connection between the armor and the helm.

When forced to fight on open ground, a rust monster will tend to strike at the nearest and largest concentration of ferrous metal, but may not be right on target because of evasive action taken by the target. In such cases, the following table can be used to determine where a rust monster's antenna strike hits:

Dice roll	Item struck
01-36	Weapon
37-64	Shield
65-85	Armor
86-95	Helm
96-00	Minor but visible metal object (belt buckle, headband, gauntlet, etc.)

Obviously, the item struck will only be affected if it is being held, carried, or worn by the target, and only if the item is metal. Re-roll if an effect on an absent or non-metallic item is indicated, or simply assign a result if only one of the above items is applicable. The rust monster never fails to rust *something* on a successful hit, as long as the target is wearing or carrying anything

metallic in plain view. If the target character or creature has no metal to be rusted, there can't be a successful hit in the first place. Even so, the rust monster will smell metal items in a backpack or belt pouch, and will relentlessly try to get at the metal it cannot see unless and until a better prospect comes along.

Metal gates, statues (even animated, magical ones such as iron golems) and the like can be affected by rust monster antennae strikes. Very large objects may take 1 or 2 rounds before rusting entirely and then collapsing. Magical objects with a "plus" get a straight saving throw, at 10% per "plus," to avoid being rusted, as per the Monster Manual. Large enchanted objects (such as an iron golem) get a saving throw vs. petrification at +1 to avoid the rusting effect. An iron golem striking a rust monster would do 4-40 points of damage, perhaps killing the creature — but if a golem carrying an edged weapon struck the antennae or the body of the rust monster with its blade and not with a crushing blow from its fist (the golem is unintelligent and does not choose its attack mode deliberately), the golem would begin to corrode immediately and would collapse into a mound of rust at the end of the following round. During this

second round, it can move only 3" without toppling, and it will do only half damage on any attack.

A rust monster antenna will take at least 5 hit points of damage before being severed. Rust monsters are apparently immune to all forms of poison, including the breath weapons of iron golems and those of brass, bronze, silver, green, and gold dragons (who must often fight rust monsters to defend their hoards), and liquid poisons produced by various creatures and by men (and smeared on weapons). Fire does normal damage to a rust monster, but acid rarely seems to have an effect (+3 on saving throw, half damage if save fails, no damage if save succeeds).

6. The bacteria can survive, and continue to act through the antennae, for 6-105 days after the death of the host rust monster, depending on the availability of food. The bacteria can thrive on previously devoured metallic oxides in the stomach and bloodstream of the monster, any metallic weapons left lodged in the monster's body, or newly introduced metal — but the bacteria will die when such supplies are exhausted. A rust monster antenna that was placed in a bowl of water with rust and a lot of metal could continue to thrive indefinitely, and perhaps could even be carried as a weapon for occasions of 5 days or less before the bacteria would need to have their food supply replenished.

A scavenger that devours a rust monster would have any previously devoured metallic treasure still in its body rusted and eaten by the bacteria, but the bacteria could *not* take over the creature so that its attacks would have the ability to rust. Only the creature known as the rust monster (sages have argued over a "proper" name for this beast for decades, but none has gained common acceptance, or seems likely to) can support the mysterious bacteria, and rust monsters do not eat each other. In the example of the scavenger mentioned above, the bacteria would die when its metallic food in the scavenger's stomach was used up, without harming the host, and would be excreted.

7. Rust monsters mate often, following a ritual in which each one of the pair makes agitated chittering noises for several minutes. If one of the adults is fertilized, a young rust monster will begin to form in the body of the parent. It will be born 4-7 months later, live, whole, and active, and will usually accompany its parent until it is full grown.

Newly born rust monsters have all the powers of an adult (there is a transferal of some of the bacteria from parent to child), but have only 1+4 HD and are size S, with a 5-foot-long tail and 3-foot-long antennae. Such a "rusty" will grow rapidly to a young, 3 HD, M-size form, with full adult-size tail (10') and antennae (7'), usually within 8 months or so, but this growth is dependent on food supply. After a year of life a rust monster is a mature adult and can mate with others of its kind.

Rust Monster

“The only warning we had was the vein in front of us melting away beneath our picks, and then they were upon us. They were hunched and armored, like cockroaches or lobsters, with scuttling legs and thrashing tails like bony fans. The noise of their chittering mandibles was bad enough, but the worst were those antennae. Soft and feathery, they caressed us all, and where they touched the metal rusted away to dust in seconds. Some of us ran, others lay still and let them take their fill. Garesk, though—he had three gold teeth.

“He was a good man. I’ll give his family the news.”

—Durg Stonehollow, dwarven mine captain

Adventurers of all races and creeds despise the rust monster—not because it’s especially horrifying in appearance, nor because it’s irredeemably evil, nor even because it’s particularly dangerous. Rather, most adventurers’ loathing for the strange creatures is strictly practical: by their very nature, rust monsters destroy treasure, and it’s not unheard of for an armored fighter or paladin to frantically backpedal away from a hungry rust monster, leaving only the wizard and his trusty staff to dispatch the beast.

OVERVIEW

Since the dawn of humanoid civilization, man’s strength has always been in his tools. Put a sword in his hand, a shield on his arm, and a helm on his head, and whole continents will fall before him, great cities rising and thriving in his wake. Yet the wise man knows he’s never more than an ounce of sharpened steel away from the bottom of the food chain, with the beasts of the field ever waiting for his soft flesh to show itself. It’s for this reason that man fears the rust monster.

Hunched and armor-plated, the average rust monster is roughly 5 feet long and 200 pounds, its orange or rust-red bulk supported by four clawed legs that skitter with surprising speed when it charges. While its appearance, with constantly moving fly-like mandibles and twitching propeller tail, would be alien and frightening on its own, most who delve into the mountain crevices and mineshafts where rust monsters are most commonly found quickly recognize the creatures for what they are: voracious consumers of anything metallic. Called “locusts of the Darklands” by some dwarves, rust monsters prefer iron, steel, and other ferrous alloys, but are capable of instantly oxidizing and devouring any metal objects merely by brushing them with their moth-like antennae. How exactly this process works is a mystery to scholars and magi alike, but not even arcane items or godly relics are capable of withstanding the alien creature’s unique ability. Many are the heroes who, after seeing their holy or enchanted broadswords rust and disintegrate in their hands, would rather face a dragon’s wrath than the blank-eyed rust monster’s mindless hunger.

ECOLOGY

Ancient beyond compare, the rust monster’s origins are lost to the sands of prehistory. While most speculate that they somehow evolved from the giant isopods and crustaceans who roam the ocean floors near geothermal vents, others posit that they might have evolved on the Elemental Plane of Earth, their endless tunneling providing younger elemental races with space to live and grow. Still others suggest that, given its supremely alien nature, the rust monster might have been introduced to Golarion by visitors from another world—possibly as an act of aggression designed to slow the march of technology by limiting younger races’ access to metals, or as living power generators for some unknown future project. Whatever the case, rust monsters stand alone in their family, bearing similarities to crustaceans, insects, and mammals, but kinship to none.

The ability from which the rust monster gains its name is one of the strangest in the animal kingdom, more unusual than even the medusa’s stare or the mimic’s shapeshifting. Like the purple worm or the xorn, rust monsters gain their nourishment from consuming minerals instead of organic matter, but the manner in which they accomplish this is completely unique.

Like the electric eel, the rust monster’s body acts like a giant battery, capable of storing vast amounts of energy and manifesting it as a unique and powerful electromagnetic field. While this field passes through the flesh of most living creatures without notice, its effect on metals is profound. When metal is contacted by the rust monster’s body—particularly its feathery antennae—a

circuit is closed and vast amounts of electrical current pour through the object, this supernaturally augmented electrolysis exponentially accelerating the normal rate of oxidization. To the outside observer, the metal simply disintegrates into uselessness. Inside the rust monster, however, a different story plays out.

The process of oxidization—called rusting, in ferrous metal—releases vast amounts of energy in the form of heat. This energy, gathered by the charged fields focused on the rust monster’s antennae, is the true source of the rust monster’s life force. Unlike most creatures, the rust monster gains no sustenance from the digestion process, having evolved to absorb energy only in its purest form. While rust monsters are frequently observed gobbling up the rust left behind after a metallic item is destroyed, this consumption serves a different function, providing the animal with key minerals it needs to form its highly metallic bones and blood. Excess metals go to form the protective carapace on its back and tail—the plates armoring a rust monster’s back are made up almost exclusively of processed iron, giving the beast its typical red-orange coloration.

While the rust monster’s feeding process is singularly elegant, it does not provide well for energy storage when compared to creatures who can transform excess food into fat stores. Instead, the rust monster is born with the instinctual knowledge that its biological clock is ticking—when its internal battery runs down, it dies. As a result, the rust monster exists in a state of constant and extreme hunger, going to any lengths to ensure that it consumes as much metal as possible. This can occasionally lead to the hungry beasts taking in more energy than they can actually accommodate, giving rise to another unique trait: the creature’s strange propeller tail. After stymieing naturalists for hundreds of years, the fan-shaped appendage is now believed by researchers to be used to shed excess heat, much like a desert hare’s long ears, its shape uniquely suited to dispersing excess energy in the form of radiated heat before the overzealous rust monster cooks itself.

This manipulation of electromagnetic fields is also responsible for the rust monster’s ability to “smell” metal at a distance. In reality, this ability to locate even miniscule metal objects up to 90 feet away is part of a greater ability to see the complex twisting of Golarion’s own magnetic fields. Around any metallic object, these natural fields distort, creating a beacon that shines bright through wood, stone, and flesh, showing the hungry monsters where to find their next meal. While their eyes are perfectly functional, able to see even in the total darkness of their subterranean homes, the weaving of the magnetic fields so overrides a rust monster’s other senses that clever adventurers can frequently escape by

distracting them with large chunks of metal armor and fleeing the other way. In places where metal is scarce, however, some rust monsters have been known to hunt and kill unarmored creatures in order to harvest the iron from their blood.

HABITAT & SOCIETY

Though heated competition for any and all available food sources makes rust monsters solitary by nature, areas rich enough with metal ore can sometimes attract swarms of them, the pugnacious beasts clashing violently whenever they come into conflict over a given delicacy but otherwise content to ignore each other. The exception to this is mating—when a rust monster comes upon enough metal that it feels consistently well fed for several weeks, it enters estrus and begins searching for a mate. Fully hermaphroditic, rust monsters choose their mates based on carapace size (a direct indicator of how well nourished a beast is) and band together just long enough to couple and raise their respective broods, with both parties carrying their young to term.

Unlike most insectoid creatures, rust monsters do not lay eggs; young are born live in litters of 10 to 12 juveniles, called “nymphs.” At birth, rust monsters are soft and partially transparent, completely boneless but already possessing long prehensile antennae—this lack of bones helps the young pass through the parent’s narrow and armored birth canal. Young are born already able to sense and consume metal, and by a year old most have already consumed enough ore to build themselves bones and carapace identical to an adult’s. (Possessing the same powers but easier to manipulate than adults, rust monster nymphs can be extremely valuable in the right markets.)

Rust monsters live almost exclusively underground, and frequently inhabit iron-rich mountain regions, though they have been known to sometimes wander into populated areas and wreak havoc by consuming vast quantities of urban infrastructure. (A city with a rust monster loose in its sewer system does not quickly forget the ensuing unpleasantness.) Even in the wild, an infestation can be extremely destructive, as rust monsters burrowing through a region in search of metals can greatly increase erosion, with whole mountainsides collapsing and sloughing away as their metallic foundations are rotted out from within.

Due to their chosen environment, rust monsters are a notorious threat to dwarven societies, with the stout

folk’s famous forges an irresistible prize to the hungry beasts. While not an everyday occurrence, the problem of rust monster attacks is common enough that most dwarven communities of a given size keep a supply of stone weapons close at hand for just such an occasion. These hunts, when they happen, are impressive and

highly ritualized affairs with a history dating back well before the dwarves emerged onto Golarion’s surface. In them, young dwarven men prove their bravery by stripping naked, painting their bodies with fungus pigments, and stalking the insectoid creatures with stone spears and axes. Not all interactions between the two groups are violent, however—though rust monsters are nearly impossible to domesticate, many groups of dwarven miners use leashed specimens to lead them to the best ore deposits.

With their formidable dietary requirements, rust monsters tend to be transient, and rarely stay in one place long enough to make a proper lair. In those cases where a given rust monster finds a vein of ore rich enough to support

it for a long time, the chambers it creates are jagged and random, pitted natural caverns connected by long, thin cracks and chasms where the beast has sucked a vein dry. These narrow passages, which can stretch for miles, also present convenient hiding places for rust monsters and their young in the face of outside threats.

It is unclear how long a rust monster’s natural lifespan is, as most eventually die from starvation or violence, but accounts of famous rust monsters indicate that they can live for several centuries, if not longer.

CAMPAIGN ROLE

Rust monsters are one of the most feared opponents in the game’s history, chiefly because they target the one resource which can’t be easily restored by magic: a party’s gear. As such, they make a great tool for putting fear into even the cockiest party, bringing terror far out of proportion to their challenge rating. Even aside from the threat they represent, rust monsters’ unique abilities mix combat up by forcing the party members to modify their standard tactics and think in new ways. It should be noted, however, that rust monsters are best used sparingly and carefully, as it’s easy for a player whose best weapon or quest object gets consumed by a wandering rust monster to feel “punished” by the GM.

Rust monsters don’t have to be just random dungeon encounters, though. They’re also perfect tools for PCs looking to destroy cursed magic items or even artifacts, and

druids face an interesting conflict in that the monsters, while aberrations and inherently an affront to nature, are also the natural enemies of corrupt modern society and technological advancement. The druid who manages to control a rust monster—perhaps even a whole pack—is capable of defending or retaking vast tracts of land from enemies who are likely to rely solely on metal weapons.

TREASURE

Though rust monsters themselves have no appreciation for treasure or material wealth beyond those metallic objects which can be immediately consumed, their lairs are often strewn with valuable items cast aside by the beasts in their quest for food. Loose gems and precious stones are particularly common, as once the metal in a gem-encrusted sword or diadem is consumed, the stones that remain are ignored by the rust monster. In fact, those adventurers who succeed in cutting open a deceased rust monster often find small gems in its gizzard as well, accidentally ingested in the monster's race to devour their corroding metallic settings.

Due to their positions near or within natural metallic veins, gems are the only valuables a rust monster might come by naturally. After them, the most common items are those stripped from fleeing or deceased adventurers and other victims. Scrolls, books, and potions are all completely safe from rust monsters, as are bows, many staves and wands, magical clothing, and other such items. In areas where rust monsters regularly clash with civilized races, these items can sometimes be found trampled and gathering dust in forgotten corners, worthless to the rust monster and left wherever they have fallen.

VARIANTS

Though most rust monsters are roughly identical save for size and the unique patterns of plates that armor their backs, several variants can be found throughout the distant corners of Golarion, some even more dangerous than the common variety. Deep below the sea, weaker cat-sized rust monsters prowl the ocean floor devouring shipwrecks, trash, and other detritus, posing a threat only to those salvage divers who seek to rob them of their valuable meals. In Sargava and lands farther south, many rust monsters have evolved an advanced way to disperse the excess energy generated by their feeding, discharging it onto opponents for 1d6 electricity damage each time they successfully consume an object carried by that character.

By far the most feared variant known, however, is the notorious beast called the rust lord, found primarily in areas where metal is scarce or has been depleted, such as the deserts of Osirion or the jungle caves of the Mwangi Expanse. These hulking monstrosities are so regularly

THEY'RE NOT ALL BAD...

Rust monsters may be terrifying to encounter in the wild, but when carefully tended and confined to wooden and stone enclosures, their unique abilities can make them extremely useful. In addition to druids and other environmental activists who might use them to disrupt the march of civilization, they can prove devastatingly effective juggernauts in warfare, especially if turned loose on fragile supply lines or used to instantly chew through portcullises and steel-bound gates to capture fortifications.

Rust monsters (or at least their antennae) can also be useful in numerous arcane practices, ranging from destroying cursed magic items to assisting in delicate healing procedures by dissolving shrapnel or steel arrowheads without exacerbating the wounds. In some extremely experimental cases, wizards and tinkers specializing in transmutation have discovered ways to siphon away a portion of the massive amount of energy produced by a rust monster's feeding, leaving the unfortunate monster just enough to survive and using the rest of the energy to power massive constructs and magnificent magical rituals.

RUST MONSTER ANTENNA WHIP

Aura moderate transmutation; **CL** 7th

Slot hand; **Price** 56,000 gp; **Weight** 2 lbs.

DESCRIPTION

Crafted from a preserved rust monster antenna, this item works similarly to a *gauntlet of rust*, with the exceptions that you can make a *rusting grasp* touch attack with the whip at will, you can use it on all nonmagical metallic objects (not just ferrous ones), and it does not protect you from other rusting attacks. This item counts as a whip for the purposes of proficiency and weapon feats.

CONSTRUCTION

Requirements Craft Wondrous Item, *rusting grasp*; **Cost** 28,000 gp (24,000 gp if deceased rust monster is provided), 2,240 XP

starved for nutrients that they have evolved to prey specifically on other living creatures, consuming the iron in their blood and tracking them by the twisting wake of their magnetic fields.

SPECIAL ABILITIES

Rust (Ex) A rust lord that makes a successful touch attack with an antenna causes the target metal to corrode, falling to pieces and becoming useless immediately. The touch can destroy up to a 10-foot cube of metal instantly. Magic armor and weapons, and other magic items made of metal, must succeed on a DC 23 Reflex save or be dissolved. The save DC is Constitution-based and includes a +4 racial bonus. A metal weapon that deals damage to a rust lord corrodes immediately. Wooden, stone, and other nonmetallic weapons are unaffected.

Metalsense (Ex) A rust lord can sense the twisting magnetic fields around metal objects to such a fine degree that it can perfectly discern the location of any metal object or creature with metallic blood (such as most humanoids) as if it could see it clearly, out to a range of 100 feet. Stone, wood, invisibility, and magical barriers are incapable of blocking this sense, and only an object containing significantly more metal, placed between the rust lord and its target, provides concealment or total concealment for this sense. For example, a man hiding behind a suit of discarded full plate has concealment, and one hiding behind a *wall of iron* has total concealment, though the rust lord might still be able to see him with its darkvision.

Bloodrust (Ex) A brush from a rust lord's antennae against flesh or thin clothing instantly draws forth the iron and other metallic minerals inside a creature's blood, tearing through the skin in a fine mist and causing 1d4 points of Con damage.

RUST MONSTERS ON GOLARION

Rust monsters have existed on all of Golarion's continents throughout recorded history, though in ages past they were primarily a subterranean phenomenon. For countless generations before the Quest for Sky, they competed fiercely with the dwarves for metals, and some believe that the increase in surface encounters over the last several thousand years is the result of the hungry beasts following the dwarves up from their ancient hunting grounds. Others worry that this is a result of them depleting all the metals farther down, in which case Golarion's ability to support modern metal-based societies might be dangerously close to exhaustion. Certainly, the beasts seem especially common in areas where dwarves first emerged onto the surface, and are a constant problem for the remaining Sky Citadels. Urgir, the fallen citadel in the Hold of Belkzen, already suffers from regular earthquakes and collapses due to the orcs being unaware (or heedless) of the swarm of beasts gnawing away at the city's subterranean foundations.

In Avistan, rust monsters are primarily found in the major mountain chains such as the Five Kings, the Menadors, and of course Varisia's Iron Peaks, whose deep roots are metal-rich enough to keep the creatures from venturing into more populated regions. In Garund, the creatures are far less common, especially outside of the Shattered Range in the south. Beneath the planet's surface, however, rust monsters can be found at any given depth in the Darklands, burrowing freely without regard to what lies above them. Those explorers who have attempted to chart the sea bottoms have even reported finding smaller versions there around mineral-rich geothermal vents, which combined with their similarities to existing bottom-feeding sea creatures lends credence to the hypothesis that these may be ancestors of the terrestrial rust monster.

Despite their uses as mining aids or beasts of war, few of Golarion's civilized races are willing to tolerate the presence of a rust monster for long. For most, this is simply a reaction to the creature's crazed hunger and tendency to destroy material wealth, but for some it takes on religious overtones. A new theory, growing popular in areas where rust monsters are most common, holds that the beasts are actually part of an infernal plot to release Rovagug from his prison in the center of the earth, the hungry monsters sent down into the depths to eventually locate and devour the mad god's chains and bring about the end of the world. While this is currently still a fringe belief, the church of Sarenrae has been known to offer bounties for each rust monster head presented, and acolytes of Gorum, Torag, and even Droskar similarly see the creatures as abominations intent on undermining their power.

RUST MONSTER

This insectoid monster is the size of a small horse, with four claw-tipped legs and a squat, humped frame. Its back is protected by a thick carapace of overlapping rust-colored plates, and its armored tail ends in a strange protrusion of fanned bone and hide. Two small black eyes perch above twitching mandibles, and from beneath each eye protrudes a long, feathery antenna.

TACTICS

Before Combat Rust monsters have little capacity for subtlety, and tend to charge straight into combat if they sense metal.

During Combat A hungry rust monster always targets the largest metal object available with its antennae, striking first at things like armor and shields before moving on to smaller items. While it employs its bite against any enemy actively damaging it or standing in its way, most rust monsters are concerned only with consuming as much metal as quickly as possible. As such, though rust monsters have frequently been known to pursue metal-bearing prey for long distances, they can often be distracted by large offerings of metallic items, giving characters a chance to escape.

Morale Rust monsters are notoriously single-minded, and will fight to the death as long as there's metal to be gained.

SPECIAL ABILITIES

Rust (Ex) A rust monster that makes a successful

touch attack with its antennae causes the target metal to corrode, falling to pieces and becoming useless immediately. The touch can destroy up to a 10-foot cube of metal instantly. Magic armor and weapons, and other magic items made of metal, must succeed on a DC 17 Reflex save or be dissolved. The save DC is Constitution-based and includes a +4 racial bonus. A metal weapon that deals damage to a rust monster corrodes immediately. Wooden, stone, and other nonmetallic weapons are unaffected.

“Good gods, it’s EATING the TREASURE!”

More Sahuagin Secrets Revealed

by Skip Williams

color illustration by William O'Connor

black & white illustrations by Arnie Swekel

The *Sea Devils*, a 96-page book of lore and game information on the mysterious sahuagin, made its debut last month. Upon reading the manuscript, editor Keith Strohm exclaimed: "Boy, I sure wouldn't want to meet these guys."

In writing the book, I tried to make it a rigorous study of the sahuagin, exploring and developing all the powers attributed to the sea devils in the *MONSTROUS MANUAL™* tome. The book also includes a similar treatment of sahuagin culture. Inevitably, deadlines and page counts forced an end to the project, leaving several ideas undeveloped. These I present here. (Sorry, Keith).

Sahuagin Technology

The sea devils possess almost 20% more brain power than do humans, and they have discovered numerous ways to overcome the difficulties of life under the sea. The sahuagin make new discoveries all the time. The items described below have recently appeared in the sahuagin's arsenal, though they remain fairly rare.

Eye Protectors

To protect their eyes against the ravages of bright light, many sahuagin don masks fitted with lenses fashioned from transparent crystal and treated with a photosensitive gel. The sahuagin weave the masks from seaweed fibers and sinew (the same mate-

rials that comprise their nets). Each mask sports four cords trailing from its corners. A sahuagin donning a mask loops two of the cords over its anterior fins and ties the remaining pair under its chin.

When exposed to strong light, the gel on the lenses quickly darkens. Anyone fitted with a pair of these goggles gains a +4 saving throw bonus vs. light-based attacks. (Sahuagin normally suffer a -2 penalty vs. such attacks.) Further, sahuagin wearing these masks do not suffer temporary blindness when exposed to magical light and can function on the surface in full daylight without impediment.

One coating of the photosensitive gel lasts about two hours. Once the gel darkens, it stays that way. If necessary, a sahuagin can wipe off the darkened gel and apply a new coating. Sahuagin females make the gel from the bodies of octopi and other sea creatures that possess protective coloration. The gel-making process is fairly time consuming and difficult, and only sahuagin nobles and their subordinates enjoy its benefit. The gel usually comes packed in small shells that hold enough for four applications. The gel works equally well when applied to normal goggles or spectacles, though surface dwellers have a hard time focusing through it (the wearer sees as though walking through light rain or fog; see chapter 13 in the *Player's Handbook* for details.). A full shell would bring 200-600 gp if sold.

Sahuagin Armor

Though unarmored sahuagin enjoy a reasonable level of resistance to physical harm, the sea devils occasionally find some additional protection desirable. The basic form of sahuagin armor is a sharkskin suit that covers the sea devil's neck, torso, upper arms, and thighs. Slits in the suit allow the wearer's fins to protrude. Straps at the neck, waist and thighs hold the suit in place. The basic suit does not improve the sea devil's Armor Class, but the process used to cure the sharkskin makes the hide resistant to fire and fresh water. A sahuagin wearing the suit gains a +2 saving throw bonus vs. fire attacks (instead of the usual -2 penalty) and suffers no additional damage from magical fire (instead of the usual +1 point of damage per die). In addition, the sea devil can endure exposure to fresh water for up to an hour before it must make a saving throw to see if the irritation forces it to retreat (see *The Sea Devils*, page 37). Sudden exposure to fresh water still has the normal effects. Because of its resistance to liquids, the suit also grants a +2 saving throw bonus against acid attacks.

The sea devils also construct heavier suits of the same basic design, but reinforced with plates of coral and shell. Such suits have all the protective qualities noted above, and grant the sahuagin wearing it an Armor Class of 3. The suit's weight and bulk, however, slow the sea devil's movement rate by one third (to MV 8, Swim 16).

The ultimate form of sahuagin armor features a basic suit reinforced with several layers of hardened bronze plates and a sort of half helmet made from bronze or a large shell. This suit grants the sea devil wearing it an Armor Class of 0. The suit slows the sahuagin's movement rate by half (MV 6, Swim 12). However, the helmet is fitted with eye protection as noted above. The suit also grants the wearer complete immunity to fresh water. The suit contains a water-retaining layer that provides a +4 saving throw bonus against fire attacks and reduces damage from such attacks by half. A sahuagin wearing the suit can function on the surface for eight hours instead of the usual four.

Sahuagin armor will not fit any other creature. The heavier versions prove much too complicated to survive attempts at alteration. However, a leather worker could merge two basic suits into a garment that another

humanoid could wear. A character wearing such a suit gains a +2 saving throw bonus vs. fire or acid attacks. The suit is non-bulky and weighs about 8 lbs. Only characters normally allowed leather armor can wear them. Unlike other protective gear, the altered suit can be worn under other types of armor.

Sekolah's Fire

The sahuagin developed this unearthly substance for use against scrag (marine trolls). An oily jelly with a pungent, fishy odor, Sekolah's fire seems more like some unwholesome condiment than the deadly weapon it is. Upon contact with water (fresh or salt) the jelly ignites, burning with a ruddy glow. When completely immersed in water, the substance burns even more furiously, creating a seething mass of flame and steam that parboils anything in it. Worse, the flaming jelly tends to cling to any creature it contacts; opponents struck by Sekolah's fire cannot escape its flames even when they leave the affected area. By some trick of sahuagin ingenuity, Sekolah's fire sheds very little light, only about as much as a bed of glowing embers, and does not adversely affect the sahuagin's light-sensitive eyes.

Sahuagin usually carry Sekolah's fire in thin metal tubes fitted with bulbs or plungers. Each tube is about twice the size of a standard potion bottle and contains enough jelly for one use. Underwater, a tube creates an oblong cloud 30' long, 20' high, and 20' wide; the cloud extends away from the user, with one of its short (20') sides centered at the tube's mouth. The substance burns for five rounds, inflicting 3d10 hp damage each round. (Though nonmagical, the fire is treated as a magical fire attack when determining the effectiveness of magical protection such as a *ring of fire resistance*).

When used above water, a tube creates a jet of flame 15' long, 5' wide at the tube's mouth, and 10' wide at the jet's far end. The jelly burns for three rounds, inflicting 3d6 hp (nonmagical) fire damage each round.

In either case, victims are allowed saving throws vs. breath weapon; successful saving throws reduce all damage from any particular dose of Sekolah's fire by half. Submerged victims suffer a -2 saving throw penalty.

The sahuagin sometimes pack the jelly into flasks that function just like flasks of oil. Underwater, a flask creates

a 20' globe of fire. Above water, a flask creates a 10' puddle of flame. Both cause damage as noted above.

Sekolah's fire produces its own oxygen and cannot be smothered or quenched by nonmagical means. A *quench fire* or *pyrotechnics* spell can put it out, though any unburned jelly in the area of affect or clinging to a creature can be set alight again (which happens instantly underwater).

Above water or below, Sekolah's fire consumes flammable items it touches and scorches everything else. Characters failing their saving throws against Sekolah's fire must attempt item saving throws for their equipment-vs. magical fire underwater and normal fire above water. Above water, Sekolah's fire sets alight any wooden structure it touches. Though the jelly always burns itself out, smothering the area with sand or other dry, nonflammable material keeps the fire from spreading.

Sahuagin priestesses concoct Sekolah's fire using blubber, fish oil, and numerous chemicals gathered from the sea. For obvious reasons, the sahuagin use air-filled spaces to mix the jelly and pack it into tubes. Usually, only the kingdom's royal high priestess and her assistants know the formula.

Sekolah's fire has been a tremendous success as a weapon against the scrag. The sahuagin also find it useful for setting ships alight and for breaking up massed groups of enemies. Sahuagin priestesses guard the secret of Sekolah's fire jealously. Generally, only forces directly under the command of a sahuagin king or prince are equipped with Sekolah's fire. Even then, only chieftains and their lieutenants carry the substance, usually one or two tubes each. Sahuagin armed with the Sekolah's fire usually employ it quickly so as to use it up before the enemy has any chance to capture a tube.

Tubes of Sekolah's fire can prove as dangerous to the sahuagin carrying them as to the enemy. If accidentally ruptured underwater, a tube explodes, filling a 15' sphere with fire as noted above. On the surface, jelly in a ruptured tube ignites if exposed to fire or dampness, filling a 5' sphere.

If sold on the open market a tube or flask of Sekolah's fire would bring 200-500 gold pieces.

Fighting Sahuagin

Sahuagin prefer to fight with their brains. Their tactics emphasize mobility,

the concentration of force, and protection from enemy counterattacks. A basic sahuagin tactic is to make a first strike from beyond the enemy's visual range. Sahuagin see at least three times as far underwater as humans and demihumans do. On the surface at night, they see roughly twice as far; this can give them a decided edge in missile combat. Sahuagin are known for attacking on the surface during the dark of the moon. This is not because they fear light, but because the darkness conceals them.

Underwater Tactics

When sahuagin note an enemy, they usually split into three groups. One group shadows the foe, while the others surround the enemy—sea devils usually prefer to attack from above, below and behind, or from the left, right, and behind. At a prearranged signal, two of the groups launch missile attacks (and cast spells if the sahuagin party includes priestesses) while the remaining group observes the results. While the attackers reload their weapons, the other group notes the target's reaction and act appropriately. They generally launch missile attacks themselves—paying special attention to opposing spellcasters—or charge in for melee attacks. It is important to remember that sahuagin are blindingly fast (they swim at a rate of 24, which is as quick as a light horse on land). Note that sahuagin relentlessly attack any spellcasting opponents to kill these magical threats as early as possible. An underwater fight against sahuagin should play out like an old western movie in which hordes of whooping Indians pepper their foes with arrows—except that most of the time the sahuagin should be out of sight.

Because most player characters don't enjoy fast swimming rates, they should have great difficulty closing with the sahuagin and effectively counterattacking. A *protection from normal missiles* spell, however, renders sahuagin darts, javelins, and crossbows harmless (at least while the spell lasts). Magical barriers such as *wall of stone*, *wall of force* and *Otiluke's resilient sphere* can give PCs some cover, and a few quick *continual light* spells might reveal the sahuagin skulking in the submarine darkness (and blind them). Divination spells such as *wizard eye* also can help beleaguered PCs track sahuagin down.

If hard pressed, sahuagin won't hesitate to use their superior movement rates to vanish into the depths only to

regroup and return after an hour or so, when a party's protective spells have expired. The best way to deal with this tactic is to leave the area immediately.

In a pitched battle with sahuagin, anything that limits the sea devil's speed and maneuverability can be helpful. Even wrestling attacks can defeat the sea devils' hit-and-run tactics. Spells such as *slow* and *entangle* prove quite effective. Finally, all characters should stand ready to assist comrades who become trapped in sahuagin nets.

Surface Tactics

After an initial attack with spells and missiles, sea devils close in from at least two different directions. If the battlefield has some obvious place where enemy reinforcements can arrive—such as a fortress or a ship's hatch—the sea devils quickly move to cut it off. One of their favorite methods for doing so is spreading out nets to catch creatures emerging from an opening; many a sailor's life has ended when he blundered into a sahuagin net and found himself stabbed with a trident or dragged, still struggling, into the sea.

Defeating sahuagin on the surface often proves a matter of sheer power. *Light* and *continual light* spells are even more effective against sea devils in the open air. Fire-based spells, ineffective underwater, slay sea devils quite readily, though parties traveling aboard ships must be very careful with them.

Other Nasty Sahuagin Tricks

Sahuagin make full use of their superior memories to recall all the details of a battlefield and its surrounding area. They often use this knowledge to choose routes of retreat that pose real dangers to pursuers. When raiding coastal areas, for example, sahuagin might make a dash for a nearby sea cliff and dive cleanly into the water upon reaching its edge. Pursuers dogging the sea devils' heels might come upon the precipice unexpectedly and suffer nasty falls.

Sahuagin always make good use of reserves in any important battle. These troops lie in wait to ambush pursuers, and they always remain ready to take advantage of any tactical situation that might develop. For example, if a town garrison sallies forth to meet a wave of attacking sea devils, the sahuagin reserve will try to enter the settlement unseen. Likewise, adventurers who surge forward to beat off attacking sea

devils may find themselves blindsided by the sahuagin reserve.

Because of their ability to sense living creatures underwater, sahuagin invariably arrange to render any area where they fight into a cloud of murk. Often they can accomplish this task without any special effort at all, as the violence of an underwater fight can stir up loose silt from the bottom and send all manner of other debris swirling through the water. The sea devils sow most underwater areas in sahuagin villages, towns, and buildings, with a fine layer of silt. If a battle erupts, the immediate vicinity (all areas within 20' of the fight) becomes murky after only 2-5 (1d4+1) rounds of combat and effectively opaque in twice that time (double the initial die roll). The sea devils use the concealment the murk provides to press the attack, to fall back to a more defensible position or to bring reinforcements to the battle secretly.

The Kalimox

The Kalimox (CALL-ee-moh) is a sahuagin memory game involving gestures and vocalizations (see the *Sea Devils*, page 54). The sea devils use it for both recreation and as a way to conduct nonlethal duels. It is possible that a character employing *polymorph* magic (or a similar magical disguise) to look like a sahuagin might find himself challenged to a kalimox. To conduct a kalimox, make three opposed Intelligence checks between the challenger and the challenged; the winner of each check is the one who succeeds his check by the larger margin. A typical sahuagin has an Intelligence score of 14 but receives a +5 bonus when performing a kalimox. Characters can add their reaction/attacking adjustments (from their Dexterity scores) to their Intelligence scores. The competitor who wins two out of the three opposed checks wins the challenge. In the event of a tie, the challenge continues, and the first competitor to lose an opposed check loses the challenge.

Skip Williams suggests that telemarketers make a good model for sahuagin because both tend to strike without warning, tirelessly attack again and again if they don't immediately succeed, and would gladly consume their own children.

SEARING FLAMES

THE ECOLOGY OF THE SALAMANDER

by Christopher Campbell · illustrated by Anne Stokes

Sinuuous and sinister, wreathed in flames like the classic image of a soul burning in Hell, the salamander is truly the stuff of nightmares. Combining two common representations of evil—snakes and fire—salamanders do their best to live up to their opponents' preconceived notions. These cruel, rapacious predators destroy all they encounter, leaving nothing but devastation in their wake. Even when such destruction is not their goal, it is nevertheless inevitable, for little can withstand prolonged exposure to a salamander's consuming flames.

Native to a harsh environment where only the strong can survive, salamanders devote much of their time to games of warfare and social dominance. Largely because they themselves are prey for more powerful beings, such as the efreet, salamanders take great delight in venting their frustrations on weaker races.

PHYSIOLOGY

A salamander's form combines the well-muscled torso of a humanoid with the lower body of a constrictor snake. Individuals might range in length from a mere 4 feet (for a flamebrother) to a whopping 32 feet (for the oldest noble salamander). Although salamanders are

asexual, their thin faces have a distinctly masculine appearance. A typical salamander's craggy features include a hooked nose and jutting chin.

A salamander's entire body is covered in thick scales of red and black that provide excellent protection from physical attacks. Spines of chitinous material poke out from between a salamander's scales. The oily liquid that oozes from the tips of these barbs is a natural waste product of the salamander's metabolism. When exposed to the intense heat generated by the creature's body, this substance bursts into flames, creating a fiery aura that radiates no more than 1 inch from the salamander. The temperature of this aura is so great that direct contact with it deals fire damage, boils away liquids, and incinerates paper.

Because of their similar appearances and close association, many believe that flamebrothers are juvenile salamanders, but in fact they are a separate species. Knowledgeable sages compare this relationship to that of goblins and hobgoblins. Although just as intelligent, flamebrothers tend to savagery and tribalism when left to their own devices. Salamanders act as a civilizing element to flamebrother society, and as with hobgoblin control of goblin tribes, salamander domination offers an often welcome stability.

LIFE CYCLE

A salamander reproduces asexually by budding, splitting off one larva every ten years. Budding is an automatic function over which the salamander has no control. The process takes 1 week, after which the salamander is particularly vulnerable to attack until its body has recovered.

The first sign of budding is a swelling at the tip of the salamander's tail. The lump grows and spreads upward through the tail, increasing in size each day. Salamanders are extremely irritable and more vicious than normal during this time. From the second to the fifth day, the lump slows the salamander's movement by one-half and prevents it from constricting. By the sixth day, the salamander's entire body is swollen, and the creature is practically immobile. It cannot attack, it loses its Dexterity bonus (if any) to AC, and its speed is reduced to 5 feet. On the seventh day, the salamander's skin splits open, releasing the original adult salamander (with a new skin) plus one larva.

For one week following budding, the parent salamander's natural AC bonus is reduced to +3 while its new scales harden. It generally tries to avoid making constriction attacks during this time, since sustained pressure is extremely painful on the newly formed skin. Once

its scales have reached their full hardness, the salamander is ready to resume its former activities.

A larva must incubate within a fire source for one full year to evolve into a mature salamander. Although dangerous in its own right, it cannot survive for long outside a fire. If prevented from

Not only is a noble salamander much larger than an average one, it also has a set of antlerlike projections on its forehead. These antlers are not for combat, as many sages believe. Rather, they somehow focus or channel the arcane energy that noble salamanders require for their spell-like abilities. Properly prepared, a noble salamander's antler can serve as the basis for a wand for any spell of the noble salamanders spell-like abilities, cutting the item's usual cost of materials by 25%. (See the *DUNGEON MASTER's Guide* for complete details on magic item creation.)

Young Salamanders

Juvenile salamanders come in two forms—the flamebrother larva and the average salamander larva. Each kind of larva must spend one year in the flames to mature. At that point, it splits to release the corresponding adult salamander.

A SALAMANDER HAS NO DRIVE TO OBTAIN SUSTENANCE...

returning to its nurturing flames for more than 1 minute, a larva cools rapidly and dies as its body hardens into a substance resembling charred wood. Because of this vulnerability, larvae incubation chambers (called blazes) are heavily guarded and defended unto death.

The maturation process works much the same as budding. At the end of its year in the flames, the larva swells, tripling in size over the course of one week. It loses its Dexterity bonus (if any) to AC during this time, and it can't move. At the end of the week, the larva's skin splits, releasing an adult salamander. Newly formed salamanders have the same vulnerabilities and restrictions as those that have just budded, and those limitations last for the same period of time.

Noble Salamanders

Noble salamanders do not reproduce. If an average salamander is lucky enough to survive for fifty years, it goes through yet another metamorphosis. Just like a maturing larva, it swells up, becoming completely immobile and helpless. At the end of one week, its skin splits, and a noble salamander emerges from the husk.

Flamebrother Larva

Tiny Outsider (Extraplanar, Fire)
Hit Dice: 1d8 (4 hp)
Initiative: +2
Speed: 10 ft.
AC: 17 (+2 size, +2 Dex, +3 natural), touch 14, flat-footed 15
Base Attack/Grapple: +1/-8
Attack: Bite +2 melee (1d3-1 plus 1d3 fire)
Full Attack: Bite +2 melee (1d3-1 plus 1d3 fire)
Space/Reach: 2-1/2 ft./0 ft.
Special Attacks: Heat
Special Qualities: Camouflage, darkvision 60 ft., immunity to fire, vulnerability to cold
Saves: Fort +2, Ref +4, Will +3
Abilities: Str 8, Dex 15, Con 10, Int 5, Wis 13, Cha 12
Skills: Craft (blacksmithing) +5*, Hide +14*, Listen +7, Move Silently +6, Spot +7
Feats: Alertness
Climate/Terrain: Elemental Plane of Fire
Organization: Solitary, pair, or cluster (3-5)
Challenge Rating: 1/2
Treasure: None
Alignment: Usually evil (any)
Advancement: 2-3 HD (Tiny)

The creature resembles a fat snake or worm with a pink hide and a mouth filled with needle-like teeth.

A flamebrother larva measures about 1 foot long. Because they require a constant fire source to mature, these larvae are encountered only on their native plane or in areas of sustained high heat, such as volcanoes. The occasional sorcerer or wizard might keep one or two as pets in a carefully tended fireplace, but this practice is exceedingly rare.

If ever forcibly removed from its fire, a flamebrother larva immediately attempts to return to it. Fire deprivation for longer than 1 minute results in death as the flamebrother larva's body stiffens and hardens into a wood-like substance.

Flamebrother larvae understand Ignan, but they cannot speak.

Combat

Flamebrother larvae use their environment to their advantage, blending into the dancing flames and striking to catch opponents by surprise.

Heat (Ex): A flamebrother larva generates so much heat that its mere touch deals 1d3 points of additional fire damage.

Camouflage (Ex): The outline of a flamebrother larva in a fiery or extremely hot area (flames, lava, burning embers, or the like) appears to shift and waver. This distortion grants it concealment (20% miss chance).

***Skills:** A flamebrother larva receives a +8 racial bonus on Hide checks made within a fire source. Although incapable of using the skill, flamebrother larvae still possess the salamander's +4 racial bonus to Craft (blacksmithing).

Average Salamander Larva

Small Outsider (Extraplanar, Fire)
Hit Dice: 3d8+3 (16 hp)
Initiative: +1
Speed: 10 ft.
AC: 17 (+1 size, +1 Dex, +5 natural), touch 12, flat-footed 16
Base Attack/Grapple: +3/+0
Attack: Bite +5 melee (1d4+1 plus 1d3 fire)
Full Attack: Bite +5 melee (1d4+1 plus 1d3 fire)
Space/Reach: 5 ft./5 ft.
Special Attacks: Heat
Special Qualities: Camouflage, darkvision 60 ft., immunity to fire, vulnerability to cold
Saves: Fort +4, Ref +4, Will +4
Abilities: Str 13, Dex 13, Con 12, Int 6, Wis 13, Cha 12

Skills: Bluff +7, Craft (blacksmithing) +2*, Hide +11*, Listen +9, Move Silently +7, Search +4, Spot +9

Feats: Alertness, Power Attack

Climate/Terrain: Elemental Plane of Fire

Organization: Solitary, pair, or cluster (3-5)

Challenge Rating: 1

Treasure: None

Alignment: Usually evil (any)

Advancement: 4-8 HD (Small)

The creature resembles a fat maggot with a fang-filled maw.

An average salamander larva ranges from 2 to 3 feet long. Like the flamebrother larva, it requires a constant fire source to mature, so these creatures are encountered only on the Elemental Plane of Fire or in areas of sustained high heat, such as volcanoes.

If ever forcibly removed from its fire, an average salamander larva immediately attempts to return to it. Fire deprivation for longer than 1 minute results in death as the larva's body stiffens and hardens into a woodlike substance.

Average salamander larvae understand Ignan, but they cannot speak.

Combat

Like flamebrother larvae, average salamander larvae can blend into the dancing flames in which they live for defense.

Heat (Ex): A average salamander larva generates so much heat that its mere touch deals 1d3 points of additional fire damage.

Camouflage (Ex): The outline of a average salamander larva in a fiery or extremely hot area (flames, lava, burning embers, or the like) appears to shift and waver. This distortion grants it concealment (20% miss chance).

***Skills:** A average salamander larva receives a +8 racial bonus on Hide checks made within a fire source. Although incapable of using the skill, average salamander larvae still possess the salamander's +4 racial bonus to Craft (blacksmithing).

MINDSET

As a native of the Elemental Plane of Fire, a salamander does not think like a creature of the Material Plane. It has no drive to propagate because budding is an automatic process. It has no drive to obtain sustenance, since smoke and flames provide all the nutrients it

requires. It has no need to secure shelter because its environment poses no danger to it. What then motivates a salamander? In a word: fire.

Born of fire, nurtured by it, and surrounded by it constantly, salamanders live by its rules and embrace its strengths. Fire burns. Fire consumes. Fire destroys. Fire represents the ultimate in strength and power, and salamanders judge all things by their interactions with it. Earth and stone smoke and crack beneath a salamander's fiery form but withstand destruction, and so they earn its respect. Metal bends to the will of fire but resists complete annihilation, and so the salamander employs it as a tool. Gems capture and reflect the light of fire, splitting it into a dazzling display of color and brilliance, and so the salamander prizes gems. All else is of little consequence. At the touch of fire, liquids boil away, paper turns to ash, and the creatures of the Material Plane cower. Thus, all of these earn only contempt from a salamander.

SOCIETY

Salamanders are most often encountered in clusters—small groups of three to five individuals, all of the same kind. On the Elemental Plane of Fire, clusters belong to a tribe, which in turn might owe allegiance to either a king or a council. Away from their home plane, salamander groupings rarely expand beyond the cluster, since the local environment usually cannot support a larger population.

A salamander tribe consists of six to eight clusters that share a communal larvae blaze and metalworking facility. A lone average salamander might take charge of a tribe of flamebrothers, but such tribes might also exist without leaders. Noble salamanders almost always rule over average salamander communities, either singly or as a group. Such oligarchies often owe allegiance to even more powerful creatures of fire, such as red dragons or efreet.

The worship of fire as both a creative and a destructive force is not a concept unique to salamanders, but as creatures born and refined to maturity in flames, they claim part of fire's divinity for themselves. As divine

creatures in their own right, they feel it only natural that they have dominion over lesser beings. This attitude leads to the practice of slavery as a means of reinforcing the dominance of salamanders over inferior races.

LAIRS

The Elemental Plane of Fire is an endless expanse of flame. Huge sheets of black basalt float in oceans of magma, and all of it has been ablaze since the creation of the multiverse. This environment is the natural habitat of salamanders and the one with which they are most familiar.

The curse of being an outsider, however, is that lesser creatures from other planes can call on you to do their bidding, if even only for a short period of time. Summoning spells expose salamanders to a wide variety of terrains and settings, and they are capable of surviving in any kind of natural environment except underwater. Sometimes, however, the summoning magic goes awry, and a salamander is unable to

**...SINCE SMOKE
AND FLAMES
PROVIDE ALL THE
NUTRIENTS IT
REQUIRES.**

return home. In such a case, the creature sets about making its surroundings feel more comfortable. Such adjustments are always made at the expense of the environment, but salamanders have no regard for anything that cannot withstand the ravages of fire.

Given a choice, salamanders gravitate toward the hottest, driest locales they can find to establish their bases of operation. A subterranean lair makes an ideal refuge, second only to an active

FAMILIARS FOR SALAMANDERS

As an optional rule, you can give the standard familiars in the *Player's Handbook* the fire subtype to make them viable as familiars for salamander sorcerers and wizards. The ability to have a familiar is an integral part of those classes, and it's unfair to restrict a salamander's choices to creatures that could not survive in its normal habitat. These fire-based familiars might also have cosmetic changes—such as orange and red coloring, an aura of flickering flames that causes no damage, or an altogether alien appearance—that differentiate them from their Material Plane counterparts.

volcano. The dryness of the desert appeals to salamanders, but the distinct lack of fuel in such a terrain poses a major drawback, since a long-term blaze is vital for raising young. Hilly areas make good salamander lairs, providing easy access to underground areas but still offering a good amount of fuel. The mining that sometimes happens in such

SALAMANDERS' METAL WEAPONS CONDUCT THEIR HEAT FOR ADDITIONAL DAMAGE.

terrain also attracts salamanders, and a cluster might try to take over a mine-shaft to gain access to metal ore. The opportunity to work metal helps keep a salamander's mind off the alien environment in which it is trapped, and fortunate is the miner who can convince one to aid in smelting his ore.

Mining operations also make mountains attractive sites for lairs. Stranded salamander clusters sometimes offer their metalworking expertise to dwarven clans in exchange for sanctuary and a semblance of normal life. Many dwarven clans regularly summon creatures such as salamanders or fire and earth elementals to help run their mining operations, and such spellcasting ability might also provide a means to return stranded salamanders to the Elemental Plane of Fire.

Perhaps the most homelike place that a stranded cluster of salamanders can find on the Material Plane is the smoking caldera of an active volcano. An added bonus is the prevalence of *portals* that usually link the Material Plane with the Elemental Plane of Fire in such environments. Experienced salamanders, especially nobles, know that the best chance of getting home is locating such a *portal* within a bubbling lava pool or a fiery jet of ignited gas.

KILLER CREATURE COMBOS

Salamanders are often found in the company of more powerful fire creatures. Many also command their own slaves.

A Red Dragon Wyrmling and Flamebrothers: Flamebrothers stranded on the Material Plane sometimes offer to watch over a red dragon's eggs or hatchlings in exchange for protection. A red dragon wyrmling raised with such creatures as its nannies and playmates not only develops a close attachment to them but also learns to exercise effective group tactics in conjunction with them. While the wyrmling uses its breath weapon, the flamebrothers attempt to flank or overbear opponents. A red dragon wyrmling and three flamebrothers constitute an EL 6 encounter.

A Salamander and Azers: Kept as slaves by many salamander communities, azers act as beasts of burden and blacksmithing assistants. Both salamanders and azers are kept as servants by the efreet. Whatever their association, these two kinds of creatures can cooperate to make flanking attacks, and both can take full advantage of their heat

special attack by employing metal weapons and making grappling attacks. One average salamander and two azers are an EL 7 encounter.

Salamanders and a Fire Elemental: Kept as pets by the various denizens of their native plane, fire elementals make ideal guards for salamanders because they are often difficult to see when at rest in the fire sources in which they lair. Two average salamanders and a Large fire elemental constitute an EL 8 encounter.

A Noble Salamander and Rasts: Noble salamanders often travel the planes in search of hidden knowledge, and often such a pilgrim keeps rasts as watchdogs. These vicious creatures readily engage opponents in melee, allowing the salamander to hang back and use its fire-based spell-like abilities without fear of harming its pets. One noble salamander and a pair of rasts make an EL 10 encounter.

A Noble Salamander Sorcerer and A Young Adult Red Dragon: This pair makes a near-perfect match. The dragon looks to the salamander for guidance in the development of its sorcerous powers, and the noble takes advantage of the dragon's superior combat expertise and ability to act as a mount. Since these two creatures work together by mutual agreement, they split treasure, with the dragon claiming items that are too fragile to withstand the salamander's heat. A 5th-level noble salamander sorcerer and a young adult red dragon constitute an EL 15 encounter.

SALAMANDERS VS. PCS

The superiority of fire can be effectively demonstrated through combat, and salamanders enjoy destroying creatures that are clearly inferior. They usually target the strongest-looking opponents first, thereby prolonging the inevitable for the weaker opponents. As fire leaps from building to building, so too does a salamander pursue its enemies. The sections below demonstrate good uses of a salamander's abilities and are intended to help a DM run a salamander NPC.

A Warm Welcome: The touch of a salamander deals fire damage—1d6 points in the case of a flamebrother or average salamander and 1d8 points in the case of a noble. Salamanders capitalize on this characteristic by employ-

ing metal weapons that conduct their heat for additional damage. A dropped weapon no longer conveys the salamander's heat, but in an environment such as the Elemental Plane of Fire, a dropped weapon never cools.

Salamanders know what materials can and cannot withstand their intense heat. A favored tactic is to wrest a weapon or other object from an opponent's grasp with a disarm attack (using a wielded weapon or its tail), then either toss it into the nearest flames or keep hold of it. Items in the salamander's possession take fire damage each round. There is no saving throw, but object hardness affects the fire damage normally.

Abracadabra: A noble salamander has access to a number of spell-like abilities that it can use to its advantage. *Dispel magic* takes care of those pesky spells that adventurers like to use to protect themselves from fire. Thereafter, the noble salamander can use a *wall of fire* to divide and conquer. The creature can use *wall of fire* three times per day, and multiple barriers of this sort can eat up spells such as *resist energy* and *protection from energy* very quickly.

Flaming sphere is a good choice for setting opponents aflame, but only if the salamander can devote some time to directing it. Summoning a Huge fire elemental to keep opponents busy can provide such time, and it also ensures that the salamander has an ally for flanking purposes if melee combat becomes necessary.

Since a noble salamander has no fear of fire damage, dropping a *fireball* on itself is a smart way to take out multiple opponents in melee. Like *wall of fire*, this ability is usable three times per day. *Burning hands* is the least useful of the noble's abilities, since the spell's range doesn't exceed its reach with its tail or weapon. Thus, it is best kept as a last-ditch defense.

PCS VS. SALAMANDERS

With sufficient preparation, a party can survive and even triumph over an equivalent force of salamanders.

Turn Down the Heat: *Resist energy* and *protection from energy* are the most logical choices for self-preservation in combat with a salamander. Layer them on; they might not stack, but any melee combat is going to involve a lot of heat. Also, if a character is unlucky enough to be targeted by a noble sala-

mander's *dispel magic* effect, chances are that at least one spell will survive.

A Cool Reception: Fight fire with cold. Salamanders have the fire subtype, which means they're particularly vulnerable to cold damage. *Cone of cold*, *Orluka's freezing sphere*, and *ice storm* are all good offensive spells, and *ray of frost* is a good cantrip choice for low-level adventurers fighting flamebrothers, since it allows no saving throw if it hits.

Energy Substitution (a feat from *Tome and Blood*) allows spellcasters to change one energy type into another specified by the feat without using up a higher-level spell slot. Make *fireballs* cause cold damage, and watch the salamanders scatter!

From a Distance: The best way to avoid a salamander's constriction attack is to stay back. Of course, average and noble salamanders have damage reduction, so be sure to load up on magic ammunition and ranged spells. If you must close the gap for combat, use the Tumble skill to avoid provoking attacks of opportunity and try to maneuver for flanking bonuses. Also, you can try to get rid of a noble salamander's magic longspear by making disarm and sunder attacks.

Alacazam: If you're facing salamanders on the Material Plane, a cleric, sorcerer, or wizard can be your greatest asset. Forget trying to kill the fiery outsiders—just send them back to their home plane. Spells such as *banishment*, *dismissal*, and *holy word* exist for just such a purpose. *Dictum* or *word of chaos* can also achieve the same effect, but since salamanders can vary in alignment along the law-chaos axis, those spells carry an inherent risk of failure. In any case, salamanders don't have spell resistance, so the odds are on your side.

NPC SALAMANDERS

Salamanders can advance as outsiders, making the NPC classes poor choices. With all good saves, d8 Hit Dice, fighter base attack advancement, and 8 skill points per Hit Die, advancing as an outsider is a good choice even when compared to PC classes. A salamander that advances in a PC class should do so to take advantage of the class's special abilities. Below are some additional suggestions for making unique and interesting classed salamanders.

Barbarian: Barbarian salamanders embrace the destructive force of fire,

SALAMANDER FEATS

These feats are recommended for constructing unique salamanders. At the DM's option, the prerequisites may be adjusted to make these feats available to other races as well.

BURNING RAGE [General]

Your rage stokes the flames of your body's heat.

Prerequisites: Con 13, heat special attack, rage.

Benefit: While raging, the fire damage of your heat special attack increases by +1d6.

GOUT OF FLAME [General]

You gain a breath weapon usable once per day.

Prerequisites: Con 13, heat special attack.

Benefit: Once per day, you can regurgitate a mouthful of flaming bile and spit it at an opponent. Your breath weapon is a 15-foot line of fire that deals 2d6 points of fire damage (Reflex half). The saving throw DC is 10 + 1/2 your HD + your Constitution modifier.

TAIL SNAP [General]

You can use your tail to hurl a globule of fire as a missile weapon.

Prerequisites: Con 13, heat special attack, snakelike tail.

Benefit: As an attack action, you can snap your tail like a whip, hurling a flaming globe at a target up to 100 feet away. This ranged touch attack has no range increment, and the globe deals fire damage equal to that of your heat special attack. Physically tiring to perform, this attack can be used a number of times per day equal to 3 + your Constitution modifier.

channeling its all-consuming power into a rage that can terrify even their own kind. Such a character is a formidable force indeed, since the Strength boost provided by rage increases the damage for all its attacks and raises its grapple bonus for constriction.

Bard: Delicate instruments such as lutes, lyres, and wooden flutes cannot withstand contact with a salamander, and while the blaring of bugles or horns might provide a pleasing accompaniment to the crackling of flames, brass cymbals or iron bells would probably make better instrument choices for a salamander bard.

Cleric: It should not be surprising that salamanders feel a strong connection with divinity, given that they are creatures of fire and therefore divine in their own eyes. Salamander clerics

can choose among the domains of Destruction, Evil, and Fire.

Fighter: Fighter is the preferred class for salamanders. Combat is the most direct way to demonstrate superiority over other beings, and in larger tribes, entire clusters might be trained as fighters. Levels of fighter can also allow a DM to give a salamander additional feats without sacrificing its current abilities.

Monk: A salamander monk makes a truly deadly opponent, especially since it has the Multiattack feat. Not only do

monk levels boost the salamander's already impressive AC, but the additional unarmed attacks it gains are even more devastating with the added damage from its heat ability.

Ranger: Ranger is a perfectly reasonable class for a salamander, especially from the standpoint of favored enemies. Many salamander rangers would select outsider (fire) in order to combat azers and efreet, their most ardent competitors on the Elemental Plane of Fire. Still others might choose humanoid (human) to exterminate the arrogant creatures that trespass on their plane and drag them across reality with summoning spells.

Since bows and arrows cannot withstand their heat, most salamander rangers select the two-weapon combat style.

Rogue: The need for weapons that are effective against their predatory neighbors and the desire to keep such weapons out of the hands of others naturally lead to the development of salamander rogues. If the owner of a *frostbrand* sword won't trade for it and is too tough to kill, the only choice left is to

steal the weapon. The rogue's evasion class ability is a great boon to salamanders because of their susceptibility to cold-based attacks. Sneak attacks can make salamander teams much more deadly, giving them the ability to deal regular damage, heat damage, and sneak attack damage all at once when flanking opponents.

Sorcerer: Sorcery is the most common form of arcane spellcasting among salamanders. The inborn talent for summoning and manipulating magical energy is considered a gift. An average salamander nearing its metamorphosis into a noble sometimes explores the magical side of its nature by taking several levels of sorcerer before gaining its spell-like abilities.

Wizard: Wizards are virtually unknown among salamanders because of the spellbook requirement. A rare few craft spellbooks out of thin sheets of brass embossed with the arcane symbols necessary for dweomercraft, but such a book costs three times the normal amount to create. Add to that the difficulty of obtaining new spells (because conventional spellbooks and scrolls are combustible), and the number of salamander wizards dwindles to a negligible level.

HUZ-FREAKIN'-ZAH!

LIVIN' LA VIDA DORKA

BY JOHN KOVALIC

The complete DORK TOWER comic strip collection, Vol. 1

The Nodwick Chronicles, Volume Two continues the saga of Nodwick the Henchman and his adventurer employers! Thrill as they battle evil deities, unravel the mysteries of alternate dimensions, grapple with cosmic power and delve into the dankest dungeons! Collecting issues 7 through 12 of the fan-favorite comic book, this volume is a must-have for hench-heads everywhere! Only \$15.95, on sale this summer!

At last! ALL the DORK TOWER comic strips from *Scribe Magazine*, *Gamespy.com* and *Interactive Week*, collected together for the first time in a beautiful trade paperback that just screams **"IT MUST BE MINE!"** Most of this collection has never been reprinted before! As *USA Today* said, "Lighten up with some fun 'toons courtesy of the prolific John Kovalic!" Just \$15.95 for this tome of hilarity!

The Ecology of the Satyr

Taking a light look at Mr. Fun himself

by **Gordon R. Menzies**

Art by Martin Cannon

The sounds of fighting drifted over the rolling, grassy hills, urged on by a playful wind. Adalia jerked her head in the direction of the noise; her long, thick braid flew off her shoulder and thumped heavily on her back. She was certain she heard it this time. No clang of steel on steel rang out, but the shouts and grunts common to any conflict were unmistakable. There were other sounds, too—husky voices that urged the combatants on. “Marsena, do you hear it?” she asked, breathless.

Marsena, the elder of the two and in her seventeenth year, had obviously heard the noises as well. She stared into the distance with wide eyes, her hands trembling as they clutched at her wooden crook. Like her sister, she was dressed in plain brown homespun, with her feet and shins protected by knee-high leather boots, as was typical of her calling as a shepherdess. “They could be robbers, Adalia, she whispered hoarsely. She looked away to see their flock drifting across the far hill. The sheep were moving steadily away from the sounds of the conflict but were at least not in a panic. Their two dogs, Coran and Pip, pranced around the dirty puffs of white, hedging them in but not impeding their progress.

“Let’s go after the sheep,” Marsena finished. “And then let’s get out of here,”

“No! Let’s go investigate—it might be a troop of elves!”

"Don't be silly! They aren't elves. . . ."

The words died on her lips as the same teasing wind that had carried the sounds of the fighting now brought a sweet strain of music to their ears. It was a quick, lilting little melody that rolled about the grass and tumbled down the hills. Marsena found herself wanting to dance after it, and a childlike smile crossed her lips before she could contain herself.

Perhaps these were elves. . . .

The sounds of fighting continued but the music didn't stop. Instead the two moved together and merged, each complementing the other, each urging the other to an even sharper intensity. Maybe the noise was coming from a group of practicing acrobats and performers. Yes, that was it. Marsena could see their gaily colored tents even now in her mind.

Adalia's eyes were aglow with excitement. The 14-year-old had dropped her crook and was already hurrying across the green, dogs and sheep forgotten.

Marsena dropped her crook as well. "Adalia! No!" And her feet carried her swiftly after her sister—and toward the music and the gaily colored tents. . . .

Clack! The heads of the two combatants came crashing together, their horns locking for an instant. Horns! thought Marsena. **They aren't elves or men at all!** Stranger still, their lower portions were so very goatlike that it caused Adalia to gasp upon seeing them. From their hiding spot, the girls could see at least a dozen of the creatures. Most were capering about, drinking and shouting, either urging on the two who were fighting or else laughing at their efforts. One creature, his fur the purest white, was playing animatedly on a set of reed pipes, the source of the strange and wonderful music.

The two combatants circled one another as the girls looked on, then the larger stood his ground. He was a huge brute with black flanks, knotted muscles, and a close-cropped beard. Grinning at the younger, leaner creature who circled him looking for an opening, he laughed and caught the wineskin another had tossed him, and he drew a great mouthful. The younger leapt at him then, grasping him about the waist with strong arms, but the youth was in turn seized and lifted right off his hooves. He landed in a heap before the larger creature, who now sprayed the fallen one with the wine he had retained in his mouth.

The entire gathering roared with laughter, slapping their knees and clutching at their sides. The loser slunk away but returned almost immediately. His head lowered in respect, he knelt before the larger and offered him a newly crafted cudgel. For his effort, the weapon was accepted and he received a cuff on the shoulder that knocked him off his hooves again. Strangely though, he was smiling when he got up. The music began anew.

Marsena wanted to dance like she had

never wanted to before, but even now faithful Coran was pulling on her clothing, her dress in his teeth, breaking the spell. Before the creatures caught sight of them, she dragged the younger girl away to tell the villagers what they had seen.

From "The Wildlands As I Remember Them," from the memoirs of Marsena Crostman, mayor of Arkright:

Satyrs are magical creatures whose upper bodies are almost perfectly human, except for their exceptional brawniness, their long ears, and the presence of two small horns on their foreheads. The lower body of a satyr is goatlike, the fur of which is generally a shade of brown or red but has been known to be black. Rare examples of white fur have also been recorded. Regardless of its coloring, the fur always matches that on the rest of the body. The horns and hooves are always jet black. The upper body, aside from being muscular, is also very hairy, and to satyrs beards are commonplace—the mark of an adult among the members of the race. Satyrs value their beards almost as much as dwarves, but beards never denote social status. Goatees are frequently worn. The faces of satyrs are quite handsome.

Most satyrs roam the woods and meadowlands in small, lusty bands¹, carousing and wenching wherever and whenever they can. They are overly fond of music

and drink; it is a sad satyr who cannot carry a tune or hold his own in a drinking bout. Typical examples of the race will carry some sort of wind instrument and a wineskin before they even think of carrying a weapon. Of course, their ability to butt with their horns almost precludes this need.

There are no females of the race. Satyrs are born of a union between satyrs and dryads. Although satyrs frequently enjoy the company of females from other races (especially lonely human shepherdesses), for some reason the incidents of half-satyrs are extremely rare. This is good, for the typical satyr attempts to woo just about every female he meets.²

Little is known of the youngest years of a satyr³, though they often recall being extremely shy as children (and just as powerfully inquisitive about their forest world). An adolescent satyr will generally seek out his father's band, and if he finds it or any other such band, the youngster is always accepted, having proved himself worthy simply by surviving. He will grow and mature quickly after this, being considered an adult and full member of the band at the age of 15 or so.

Obviously, given the male-dominated society satyrs live in, with no positive feminine influence save for those first years, they are always gruff, masculine creatures. They hide their true emotions,

If there's a pain in your chest, be a pain in the neck.

Complain to a doctor.

though they tend to be quite outgoing⁴. Satyrs don't understand male-female love beyond its physical aspect, and marriage is a totally alien concept to them—they are forever bachelors. No satyr could hope to restrain himself from the charms of a new female that happened along.

Relationships with other males are quite another thing. The physically strongest satyr in any band is always the leader⁵; druidic types⁶ never rise beyond the title of "advisor," and even then they are rarely consulted, despite the respect the rest of the band holds for them (it is considered a sign of weakness in a leader to seek too much advice or magical assistance). The leader of the band has no verbal title to which he is referred, save when the band is dealing with other races. In this case, he would be given the title "Chief."

A leader reigns in one-year spans, renewed or lost each spring in a special ceremony known to the satyr as the Rutt. Basically, the Rutt is a trial of elimination through bare-handed combat among all mature members of the group. Satyrs consider the use of their horns legal in this contest. The battles are never to the death, as the intent is to humble the loser and acknowledge the superiority of the winner. Eventually, the overall leader is established and given homage by all, in the form of food and drink, musical instruments, weapons, and similar gifts a satyr

would consider useful. The leader is also given first choice of all willing females the band comes across.

This type of conditioning affects the satyr beyond his natural social group. To entice a satyr to join a party of male adventurers, the respect that the satyr associates with friendship must first be established. This is done in only one way—the prospective "friends" must be battled to determine dominance (friendship will occur, all other things being equal, no matter who wins). However, if the satyr wins, he will expect to be considered superior to his friends in all ways, and he will want to make all the decisions for the group. Thus, a satyr will always consider himself better or worse than everyone else, fighting everyone he meets to establish this. Magic is disdained during such contests as much as is the use of weapons, as both are considered to be the mark of a coward. As during the Rutt, satyrs will not fight to the death during such battles. A party's alliance with a satyr will always be a rough-and-tumble experience at first.

Female humans, elves, and the like have an even more difficult time with satyrs, as they are considered good for one thing and one thing only. A female who cannot defend herself, or one who isn't obviously the partner of another male, will be courted tenaciously. The satyr will sing and play for her, vigorously proclaiming his love for her, though he would offer his affections just as copiously to any other female who happened by. Male defenders of a lady's honor will be battled to determine dominance, with the winner having the "right" to woo the female. Satyrs are completely unable to conceive of this as being wrong. Females who manage to put off the satyr's overtures are forever considered honorary males, as a "real woman" couldn't possibly turn the satyr down. This putting off may take some time, as every satyr considers himself a Casanova and will certainly be a problem in the meantime.

All satyrs are musically inclined, and many make their own "Pan pipes" from local materials. But once in a while, a satyr will craft and master a set of magical pipes⁷; the one who does soon rises to an exalted position within his band, though his chance at seizing leadership is no greater than others (resorting to the use of the pipes during the Rutt would brand him a coward). These magical pipes are known to cause listeners to fall asleep, be seized with fear, or to become entranced should certain melodies be played on them, but even without these effects, satyrs find the pipes useful in wooing women, making friends with other sylvan creatures, and threatening their enemies. A satyr lucky enough to craft a set of these magical pipes may never possess more than one, nor can he craft another for someone else. The construction of a set of pipes (magical or otherwise) takes a

full week, wherein no other activities save the basic functions of living can be pursued. If lost or destroyed, another set may be made, but under these conditions only. No more than one satyr in any band will possess and be able to employ the magic pipes. If another happens to gain the ability, he goes off on his own to seek another "pipeless" band, into which he will always be happily accepted.

The pipes never give off a magical dweomer because in fact, the magic comes from the satyr's intuitive knowledge of music. The finely crafted reed pipes are merely a focusing agent for the magic. Many a thief has been disappointed after going through the dangers of obtaining such a set.

Sometimes a satyr, probably seeking more excitement in his life, will agree to join a group of adventurers. In general, a satyr makes for a tough opponent, so the presence of such a creature is rarely undesired in an adventuring party. His ability to survive and dwell in harmony with nature⁸ makes his company a boon to those seeking to traverse a sylvan wilderness. Mind you, satyrs are rarely as reliable as a human ranger would be, or as reassuring as the presence of an elf. Satyrs have short attention spans; they are very much creatures of the moment and rarely plan ahead. Although they are suitable companions for a short stint, they can rarely stay interested in an adventure long enough to continue it for more than a week at most. They will certainly leave when it suits them, often without so much as a word of explanation.

However, the presence of a satyr will always mean one thing: a lot of fun. The satyr sings and dances on the gloomiest days, but this may well serve to irritate rather than cheer fellow adventurers. He is especially well received by those with the baser instincts of drinking and wenching in mind, for these are part of every good satyr's personality.

It would seem that satyrs have little time to spare for matters of theology, but they do have several holidays that pass as religious in some sense. The Festival of Pan generally follows the Spring Rutt in which the band leaders are determined. Pan is honored but once a year and is considered to be the patron god of wine and music. Individual groups of satyrs gather in secluded glens to hear humorous tales of Pan's many exploits, narrated by their druidic priest or by their leader if a druid is not present. Contests of music and drinking bouts follow this, the winners of which are crowned with wreaths of spring leaves. Furthermore, a great bonfire is built, into which are hurled skins of good wine and finely crafted musical instruments. This sacrifice of material goods brings an end to the ceremony.

Skerrit, the god of the centaurs, is also honored by the satyrs. They refer to Skerrit as the Hunter in the Green, and the

ceremonies dedicated to him take place each month on nights of the full moon. Satyrs band together in large clearings in isolated groves on these nights, with sometimes as many as a dozen different groups. Ritual mock hunts and fierce wrestling contests are held in the moonlight around a roaring fire. The winners that come out of these two events are called Hunters for the entire month to follow, the titles to be renewed or lost at the next gathering. Hunters are given choice food in the interim and are honored as the Chiefs' personal bodyguards. Tales of the great hunting exploits of Skerrit are then related by the most prominent druidic priest present. These stories are followed by a fabulous feast of wild game hunted down earlier that day. Afterward, before dawn, the bands disperse into the trees.

As can be seen, though the satyrs are a flighty and frivolous race, they are well in touch with the land and their patron gods. Unlike many races, however, they unfortunately have no stories of creation—either of the world or themselves. Sadly, not even the satyrs themselves can give us any insight toward the secret of their origins.

Footnotes

1. Satyrs live to be over 200 years old. The age of any one satyr in a group may

be determined by rolling 1d20, multiplying the result by 10, then adding 1d10 (with a 10 equalling a 0 on the last roll).

2. See DRAGON® issue #87, "The Ecology of the Dryad," and issue #109, "Hooves and Green Hair" for more on the relationship between dryads, satyrs, and humans.

3. Young satyrs reach maturity at about the same rate as human males, staying with their dryad mothers until they are about 12 years old. Then they are left in the care of their satyr fathers, who train them in all matters important to a satyr (e.g., wenching, drinking, frolicking, music making, etc.).

4. Because of the satyr's state of mind and social values, charm spells have quite interesting effects depending on the sex of the spell-caster. If a satyr fails his saving throw against a male spell-caster, he immediately attacks the spell-caster to establish dominance and is thereby acting accordingly to the "friendship" the spell implies. If he does make his saving throw, he might attack anyway—but the spell will ensure that the attack will be immediate.

Failed saves against a female spell-caster means the satyr will be even more obnoxious in his attempt to woo her. Here the satyr will become the jealous lover, keeping all males away from his "true love." To reflect the satyr's spell-strengthened vigor,

give him +2 on all attack rolls when battling "competitors." The lovesick creature will go to great lengths for his lady and will generally be as great a pain in the neck as possible.

5. Leaders (the satyrs with the most hit points of their bands) always have at least 16 strength, with a maximum of 18/50. Roll 1d6: 1-2, 16 strength; 3-4, 17 strength; 5, 18 (nonpercentile) strength; 6, 18/01-50 strength.

6. There is a 20% chance that any band will possess a "spiritual guide" among its numbers. This satyr is a special NPC shaman with either clerical or druidic powers of up to 6th level. Satyr shamans do not seem priestlike at all in behavior, as they uphold the "highest ideals" of satyrs everywhere—and one can easily guess what those "ideals" are!

7. Every satyr who tries has a 10% chance to be able to craft the magical pipes, but if there is already a magical piper present, few will feel the need to even try. Upon occasion (1%), a prospective musician crafts a set unintentionally, and he will then leave for another band.

8. All satyrs should have some tracking ability, at 20-80% accuracy. Satyrs have any of the usual bonuses or penalties associated with tracking creatures in the wilderness.

Ω

The ecology of the SEA LION

by Ed Greenwood

"What's this I hear about sea lions in the Realms being, ah, really some sort of aquatic lion?" I asked, as Elminster paused on the heels of a few rollicking tales of the deeps. The old sage blinked.

"Aye. . . . What other sorts of sea lions are there?" he asked suspiciously, no doubt thinking this would turn out to be another of my jokes.

I told him that seals in our world were called sea lions by some, and he snorted. "Why not just call them seals?" he asked, as though everyone in our world was crazy. (He could, I often think, be right.)

"Well," I continued, "are these sea lions — which we don't have here, by the way — important? I mean, in fable, land-lore, monster-slaying stories; that sort of thing."

The old sage thought for a bit and then nodded. "Ye remember the arms of Tethyr that I showed ye some time ago?" I did, and recalled aloud (as I pulled Elminster's sketch from my files) that there were sea lions in that coat of arms. Elminster nodded again.

"I'll tell ye," he said slowly, "the tale of Nearel and the sea lions." He coughed a few times and began sonorously.

"Of old in the land of Tethyr, there was a king, Mhoaran the Tusk-Bearded. A mighty man was he, tall and broad and thewed as a great hero — and coarse, fire-tempered, and brawling, to boot. He took his throne by force of arms and held it for many long years despite the rebellious nobles of the land, who supported three surviving (and well hidden) kin of the previous monarch. These nobles managed to slay, usually by poison, any heirs Mhoaran fathered, until there was not a one of the nobles whom Mhoaran would trust. Moreover, three successive queens died mysteriously, and the lonely and bereaved king grew bitter, grim, and wild.

"He took to spiriting his sons away from their birth-beds and riding far from his court, offering lands, riches, and noble titles to commoners who would raise him an heir in secret. Many families accepted — but the king's enemies had agents, too, and these agents almost always found and slew both the royal infants and their foster parents. In all the long years, Mhoaran lost twenty-six sons and himself grew more feeble as, despite his precautions, occasional poisons did their work on him.

"Only two of his sons are known to have

survived past childhood. One's lineage was suspected, and he was slain in combat while but an untried youth. The other one, Nearel, grew up in a fisherman's hut on the Sword Coast, where he helped his foster father with fishing — and with the capturing and taming of sea lions, which was the man's special interest.

"It happened that about fourteen years after Nearel's birth, King Mhoaran took ship north up the coast to Waterdeep, to meet with other rulers of the Realms. Fearing an attack, the king kept his vessel close to shore, slipping along by night and remaining, in safe harbors by day. Mhoaran's enemies were closer than the king had thought, and he was roused one night by the clash of steel outside his cabin door.

"Now, Mhoaran was a bull of a man, a

fighter of awesome repute, even in the elder days of his reign. But he was only one, with his bodyguards dead beyond his door, and he faced nearly forty. He stood his ground in silence, in his darkened cabin, and answered not their taunts and threats, for he knew arrows would be his sure death if he opened the door or let light reveal him.

"With blade and axe he waited — and fell like a demon on those who picked his door-lock and slunk in. Lit torches were hurled into the cabin by those in the passage. Mhoaran wielded them like blazing clubs and one by one hurled them out the sea-windows of his cabin as he fought — until he stood again in darkness, surrounded by dead men: The king then piled corpses in the doorway, so that the light would not locate him clearly, and waited.

"Again the traitors charged in to slay the king; again he fought, and was sorely — wounded, but battled on in deadly silence, until the last of this group of attackers turned and fled. Mhoaran heard much heated discussion from the passage outside his chamber as the king tied garments on the worst of his wounds, but bled through the bandages, and grew weaker. He heard the traitors decide to burn him out, and he knew that they would in the end succeed. Quickly, before someone thought to send archers to the rails to loose shafts at him as he swam, Mhoaran slipped out through a sea-window and made for shore.

"The water was icy cold, and the king very weak. The weapons he bore dragged at him as he swam, and he was heard from the ship. Mhoaran spat silent curses at the waning moon, for it still cast a feeble light over the waves, and shafts began to hiss into the water near him. The shore was far off, and the king despaired — for he could hear a boat being launched, behind him, and when he swam on he saw in the moonlight another small boat ahead of him.

"For a moment he thought this second boat was someone sent out from shore to slay him, by some treacherous arrangement. But as it drew nearer he saw that it held only one man — a youth, and weapon-

less. The youth saw him and said, 'Who art thou? Cast away thy weapons and I will take thee in the boat.'

"Mhoaran was loath to let go his weapons, but his strength was nearly gone anyway, so he complied, giving his name but not his title. The youth took him aboard, rolling him into the bottom of the boat atop bulging sacks that reeked of fresh-slain cattle. The youth saw the small boat hastening toward them from the king's ship and said to Mhoaran, 'Who are these that would slay you?'

" 'Traitors,' Mhoaran answered.

" 'Traitors?' echoed the youth. 'To the king?'

"Mhoaran admitted his full identity, and the youth did not seem overly awed. 'If I save thee,' he asked, 'may I come to court? For I would be a swordsman.'

" 'Aye,' Mhoaran said. 'I can promise that. Wilt thou tell me thy name?'

" 'I am called Nearel,' the youth answered, and straightaway he leaned over the side of the boat while holding in his hand a short, flaring horn or trumpet carved of wood. He plunged his head into the icy waves and blew the horn, which made a deep, roaring noise. Nearel straightened up and turned, dripping, and warned, 'Stay away from the water,' as he untied a sack.

"Suddenly, the water around them boiled, and the king saw a huge curve of scales, dripping claws of fearsome size, and then one — two — four leonine heads rising out of the depths around them. Nearel raised the horn again and winded a deep, roaring bellow. This signal ended in a cough, and there came answering coughs and growls from the waves about them.

As an arrow slashed into the water nearby, Mhoaran realized that the boat crowded with swordsmen had drawn very close. Nearel stood up, hurled the contents of a sack toward the other boat, and roared again, this time in a high voice. Then, as Nearel ducked low to avoid flying arrows, Mhoaran saw the sea-creatures turn in the water and charge at the pursuing boat, trailing wakes like many small ships. In a moment there was a muffled crash, and then the full-throated roars of lions were heard in the darkness. Mhoaran made out the shape of the boat as it rolled over, and he heard the thrashing of men in the water, punctuated by an occasional scream. The lions dined, and all of the armed company perished, leaving the king and Nearel alone on the waves.

"Faint roaring could be heard beneath them, and the sea lions came up to the surface again, huge and fearsome. 'They yet want their dinner,' Nearel said, and began emptying sacks overboard. The king helped him until their boat was empty of meat, and deep purring was heard from all about. Then Nearel turned the boat about and rowed to shore. When Mhoaran laid eyes on Nearel's father, the king knew that he had found his own son.

"When Nearel came to court, he came by sea, standing on the backs of two sea lions. In later years Nearel fed his sea lions from the windows of his own tower, for the royal castle stands on a rock isle in a salt-water lake. And that is how the arms of Tethyr came to be supported by two sea lions."

We talked on late into the night, and hereafter follows what details of these creatures I could glean from Elminster.

Sea lions are large, powerful predators that inhabit undersea lairs (sometimes large wrecks in calm waters, but more often caves or rock clefts). They will move to another area if food becomes scarce or other predators too aggressive, persistent, and numerous. Sea lions are afraid of nothing, but they are inclined to be indolent — and thus, efficient killers and creatures who have no taste for fighting over food when it can be had elsewhere with less effort.

In a family or as a loner, a sea lion will hunt in a familiar area and rarely stray from it. The creatures are seldom a danger to humankind, demi-humans, or humanoids except in cases where they view individuals of such races as prey — a lone swimmer, for instance, or a small group of pearl divers.

Sea lions are useful, if tamed and properly trained, as aquatic guardians or hunters (sometimes for sport, as in the

island kingdom of Nimbral). Minstrels and bards sometimes refer to female sea lions (or, more carelessly, all sea lions) as "lyonesses"; hence the expression "like a merman riding a lyoness," said of someone who sits unconcernedly in a sinking ship, or a vessel adrift. Many undersea creatures have been known to train sea lions; any such arrangement will suit the beasts because it enables them to live relatively free of pain and danger, and obtain, food more often and more easily than in the wild, so long as the sea lions get exercise and a chance to hunt for themselves fairly often.

Many men along the Sword Coast have trained sea lions, intending to sell the tamed specimens or to use them in salvage, fishing, and sea warfare. By the use of rewards (of food) and punishment (withholding food, expressing displeasure vocally), patient trainers can slowly steer a young sea lion's behavior toward more acceptable habits. However, adult sea lions can never be so trained by surface-dwellers; full-grown specimens will seek to slay any captor at every opportunity, heedless of their own safety.

Young sea lions will occasionally rebel in training; if they can be physically bested by the trainer (bad or lazy trainers clip a sea lion's ears to break its spirit), no harm will be done to the training process. If, however, the young creatures learn that they can defy their trainer with impunity, or prove often rebellious, they are unfit for training and

should be released into the wild.

Few sages have examined sea lions, and fewer still observed them in the wild, but here follows what factual material Elminster has gathered:

Sea lions are robust, healthy creatures who usually die in combat; they rarely become diseased. Both sexes have manes, similar coloring, and scales over their entire body surface except for the head area. Their flipperlike forelimbs end in sets of claws (not retractile) that can do more damage than the strikes of a lion. Likewise, the bite of its strong jaws is more dangerous than the bite of a lion. A sea lion propels itself through the water by "rowing" with its forelimbs and sweeping its fluked tail back and forth. A system of gills enables sea lions to take in oxygen when underwater, but they can also inhale air as a lion does, which enables them to travel on the surface of the water for relatively short periods.

If healthy, sea lions mate every 9 months or so, the female giving birth 7-8 months later to 1-3 live, fully mobile offspring. Young sea lions are AC 8/6 when born (their scales are still flexible and soft), have 2 HD, move 14", and do damage of 1-3/1-3/1-8. Such young cubs are watched at all times by the mother (or, if in a family pride, 1-2 females) and kept in the lair, where they are fed by other members of the family that bring home their kills.

If the hunting is good, the young will grow rapidly; by 3-4 weeks of age, they will

be AC 6/4, move 18", with attacks for 1-4/1-4/2-8 damage. For the rest of the first year of their lives, they remain at about this size, growing and developing internally. They learn to hunt during this time, always under the watchful eye of an adult female. The guardian keeps the young within a half-mile of the lair, nipping and roaring at cubs who do not want to be herded where she wishes them to go. In the following two years of life, sea lions begin to hunt alone (tentatively and carefully rather than boldly), and are identical to adults except that they have only 5 HD, gaining the sixth in the fourth year of their existence.

Most sea lions die violently and at a fairly young age, but some have been known to live more than eighty winters. The muzzle of a sea lion grows gray with age.

Sea lions usually live in family groups, known as prides, made up of 1 mature male, 1-2 young males, 2-4 mature females, and 1-3 young females. Old females will be cared for by the family until they die; old males usually die in battle. A young male either defeats the head of a pride to take his place, or is driven out to hunt alone until he can take or build a pride of his own.

Hunting packs may be a family pride (35% chance), but are more often (65%) adult males, sometimes accompanied by adult females or young males, who have gathered together under a strong leader to take on strong foes (such as sharks).

Adults will drag prey to their lair when it is unsafe or imprudent to eat where the prey was killed, or to feed young, but will not do this if it would reveal the location of the lair to a powerful foe. If a sea lion is hunting and there is more than one prey to be had immediately (when a group of whales is encountered, for instance), it will often try to disable a victim and then turn to fight others, rather than finishing off the kill. Thus, young sea lions in the second and third stages of growth sometimes hang about the edges of a battle, waiting to dart in and drag away disabled prey while the adults continue to fight off the more healthy foes. Sea lions never slay wastefully; they will kill enough to feed themselves (and their trainer or family, if any) and no more. Of course, one will fight incessantly if it is threatened by a group of adversaries and escape is difficult or impossible. Sea lions are intelligent enough to usually be able to sense when an enemy might be too powerful for them, and can certainly tell when a combat or battle is going badly, and will not hesitate to flee (if possible) under such circumstances.

The lairs of sea lions contain all manner of treasure that is not destroyed by water, usually including a great variety of small metallic litter — chiefly coins, but also many items of no appreciable value. Sea lions do not consider their treasure valuable, and will not fight to the death to defend it or their lair, although they will usually try to drive away any creatures approaching their lair in order to establish their territorial rights.

SOME REFUSE TO DIE in the AFTERMATH!

AFTERMATH! is a role-playing excursion into a post-holocaust world for 2 to 6 players and a referee in search of a different kind of adventure

- Basic Rules book with multiple examples of play.
- Players' Handbook detailing character generation, equipment, and life after the Ruin.
- Referee's Handbook detailing construction of the environment and running the game.

AFTERMATH! provides for modern firearms, NBC weapons and protections, mutations, survival, high technology and more. The game is structured to allow the referee to decide the nature of the holocaust that destroyed civilization in the world in which play will occur. The boxed set also includes an introductory adventure, character sheet, and judge's screen with the three volumes of rules. AFTERMATH! is a step forward in the art of role-playing games.

\$24.00

ALSO AVAILABLE:

- INTO THE RUINS: the city of Littleton. Adventures 20 years after the ruin. \$6.00
- OPERATION MORPHEUS: a university setting some 100 years after the Ruin \$8.00
- SYDNEY: THE WILDERNESS CAMPAIGN: an entire city campaign pack. \$7.00

CAN YOU SURVIVE?

Available from better shops worldwide, or direct from Fantasy Games Unlimited at P.O. Box 182, Roslyn, New York 11576.

*There are no shadows in this world save those
that serve the will of the shadar-kai.*
—Sallan Kath-Moran, shadar-kai adept

THE ECOLOGY OF THE

SHADAR-KAI

Cursed by shadow, the shadar-kai hunt in twilight. They seek revenge for some half-forgotten wrong, emerging to steal power and information then slipping back into the shadows. The shadar-kai, also known as the shadow fey, have a great affinity for subtlety, cruelty, and stealth, yet they also carry a deadly curse, a curse that dooms their souls to a netherworld of shadows. Like many fey, they are bound to nature and despise those who despoil it, but where other fey protect nature for its own sake, the shadar-kai do so that they alone might draw upon nature's wealth and power.

HISTORY OF THE SHADAR-KAI

What joy and light once dwelt within the hearts of the shadar-kai was long ago lost to the shadows of their own history. In the early days of the world the shadar-kai lived

as other fey, bound in peace to nature and life. Yet always shadow and shadar-kai were as one, the pale-skinned fey harboring secrets of and influence over the mysterious Plane of Shadows. As eons passed and mortal creatures began to rise in power, the greatest spellcasters of the shadar-kai gazed deep into the swirling, timeless tides of that darkened plane, revealing a prophetic vision of nature pillaged by the mercurial whims of lesser races. The mighty among the shadow fey called for some strike against the races that would one day wreak this destruction, but the shadar-kai were never great in number and they could not through might or guile alone prevent the future they foresaw.

Thus, while their goal to prevent a ruinous future might have seemed innocent, their solution was not. Calling upon their innate intimacies with shadow and potent magical

skills, the shadar-kai sought a way to darken the world.

The legends of the shadar-kai tell of a hundred shadow fey—each a master of ancient magics—joining together to perform a ritual, one that would irreversibly bind the world of mortals and the Plane of Shadow together. From this twilight, their innate bond with shadow and their long-practiced rituals would give the shadow fey mastery over this new environment, allowing them to secure the sanctity of nature as they saw fit.

Yet even the shadar-kai could not see the dangers lurking within the shadow.

As their mighty ritual progressed, the shadow fey stared into the depths of the realm of shadow and learned that they as an entire race would become that place's conduit into their world. Forming a darkened nexus upon the Plane of Shadow, the shadow mages' magics bound the souls of every living shadar-kai to this single point. At the culmination of their great ritual, the very essences of the shadar-kai would drag this shadowy

anchor into the Material Plane along with the entire dark realm, joining the two forever.

There were those, however, who opposed the shadow fey. Heroes of this forgotten age, servants of primeval orders, and outsiders guarding what their masters had created sought to stop the shadar-kai and their dark ritual. Through countless shadow

fey guardians, these bygone warriors entered the Plane of Shadow and found the cyst the shadar-kai were creating, the nexus of extraplanar darkness bound to the very souls of the shadow fey. At the apex of the shadow mages' ritual the opposing heroes made a great and forgotten sacrifice, interrupting the rite to bind the two realms. The resulting magical backlash was

KNOWLEDGE OF THE SHADAR-KAI

The following table shows the results of a Knowledge (nature) check regarding shadar-kai. Those who study the magic of the natural world, the Plane of Shadow, and the most ancient of histories might possess this information.

Knowledge (nature)

DC Result

- | | |
|----|---|
| 10 | The shadar-kai are evil fey with a strange relationship to shadow and darkness. |
| 15 | Shadar-kai are extremely stealthy and skilled at attacking from the shadows. It is their stealth and cruelty rather than physical or magical might that makes them dangerous. |
| 20 | An ancient curse draws the souls of the shadar-kai to the Plane of Shadow, where they cannot escape without great magic. They make special devices called gal-ralan to help combat this curse. |
| 25 | The shadow curse affects the shadar-kai constantly, making them partially out of touch with the material world. Certain magic and rendering them unconscious can weaken the shadow fey and eventually banish them to the Plane of Shadow. |

THE MAGIC OF THE SHADAR-KAI

Since the ritual that brought the shadow curse down upon them, the shadar-kai have struggled to escape its incessant pull, developing a variety of magic—like the *gal-ralan*—meant to loosen its grip or strengthen their own waning abilities.

Shadowslip

Illusion (Shadow)

Level: Brd 3, Sor/Wiz 3

Components: V, S

Casting Time: 1 standard action

Range: Touch

Targets: Creature touched

Duration: 1 round/level

Saving Throw: Will negates (harmless)

Spell Resistance: Yes (harmless)

Shadows twist and twine about the target, forcing many blows directed against it to go awry. The subject of this spell benefits from a 20% miss chance as if it had partial concealment.

In addition, any time the creature moves, it can move through the Plane of Shadow rather than through the Material Plane. Moving in this manner slows the creature to half speed, but does not provoke attacks of opportunity. The creature moves only through the fringes of the Plane of Shadow and cannot pass through any barriers or other obstacles on the Material Plane. The creature remains in the Plane of Shadow only while moving, and returns fully to the Material Plane at the end of each move action.

Special: Shadar-kai under the effects of a *shadowslip* spell do not suffer the effects of the shadow curse. While any negative levels they had gained as a result of the curse previous to casting this spell still affect them, they cannot gain further negative levels from the shadow curse for the duration of the spell.

Shadowlight Oil

Shadowlight oil is a slow-burning oil that contains some small touch of the Plane of Shadow and can be burnt in any regular lantern. A lantern filled with shadowlight oil does not provide bright illumination over any area, but instead provides double the area of shadowy illumination that a lantern burning normal oil would. The table below summarizes the effects of shadowlight oil in normal lanterns.

Lantern	Bright	Shadowy	Duration
Common	n/a	60 ft.	6 hr./pint
Bullseye	n/a	240-ft. cone	6 hr./pint
Hooded	n/a	120 ft.	6 hr./pint

One pint of shadowlight oil weighs 1 pound, costs 5 gp, and requires a DC 25 Craft (alchemy) check to create.

titanic, scattering and killing countless shadar-kai and scouring both planes of any evidence of the sinister shadar-kai mages and the mortal realm's champions.

While the eternal twilight of the Plane of Shadow remained apart from the mortal realm, what ties the shadar-kai had forged could not be undone, only altered. The shadowy chains

bound to the souls of the shadar-kai reversed their pull, dragging their very essences into the realm they had hoped to enslave, forever corrupting the bond into the dreadful shadow curse.

Today, their homes decaying and empty as their populations are claimed by a darkened netherworld, the shadow fey obsess over their past folly and failure. Turning crueler

with each generation, the shadar-kai have largely become a race of scavengers and unrepentant murderers, all desperately searching for some means to keep their souls from the shadow's grasp.

PHYSIOLOGY OF THE SHADAR-KAI

Shadar-kai stand slightly taller than the average human and move with a speed and grace that few mortals can hope to match. The slender shadow fey weigh about 10 pounds lighter than humans of equal height and their long limbs are swift and flexible rather than delicate. The shadar-kai have extremely keen vision, allowing them to see twice as far through shadow or weak light as even the most keen-sighted elves. Being fey creatures, shadar-kai have incredibly long life spans, possibly even bordering on immortality. Although no—or extremely few—shadar-kai still live who remember the time when the shadow curse was bestowed upon their race, there are many who heard the ancient tale from their ancestors first hand.

Darkness is always with the shadar-kai and their bond with the twilight is easy to see. Shadows seem to bend to conceal the soft movements of the pale fey and with the slightest effort they can wrap this shade around them. This almost physical manipulation of shadow allows the shadar-kai to be seen only when they wish, and even the most wary sentries have failed to notice groups of shadar-kai slipping by in the darkness.

Yet, despite their control over darkness, every shadar-kai lives in fear of the debilitating shadow curse and the ghostly Plane of Shadow. As muted visions and dulled sensations pervade the realm of shadow, the shadar-kai have found that vivid and sharp sensations serve as precious handholds to the Material Plane. While moments of ecstasy and joy might serve their needs, the embittered mindset of the shadow

SHADAR-KAI ON THE PLANE OF SHADOW

Only a small population of shadar-kai actually exists on the Material Plane, the vast majority having been drawn to the Plane of Shadow over the centuries. While shadow fey regain lost levels and abilities upon submitting to the shadow curse, this is of small comfort. Being fey, shadar-kai are creatures of the Material Plane, specifically bound by nature to the world they dwelled upon. Separation from this home is an endless torment and all shadow fey feel like devoted guards forcibly separated from their posts, ever awaiting news of some calamity they've lost all opportunity to oppose.

The shadar-kai of the Plane of Shadow are more subdued than their brethren who still struggle upon the Material Plane. While some still toil to find a way back to their natural homes, most have submitted to a kind of race-wide despair. Living either as crazed brigands or despairing vagabonds in the shadowy doubles of their ruined cities, no passion, happiness, or hope fills the lives of these fallen fey. While these shadar-kai no longer scar and torture themselves, their hatred of all humanoid races is even greater than that of those on the Material Plane, and travelers through their shadowy domains are mercilessly hunted and gruesomely punished. The merest suggestion of a way back to the Material Plane, however, results in the immediate attention—even subservience—of the shadow fey, although those who make and fail to follow through on such claims meet lengthy and unimaginably agonizing ends.

fey makes extreme pain one of the most useful tools for keeping their souls anchored to the mortal realm. As such, shadar-kai regularly scar themselves with deep and complex tattoos, pierce their bodies with hoops and nails, and cut their flesh with blades of cold iron—the bane of all fey. The last of the shadow mages have even invented wearable torture devices called gal-ralans, excruciating cold iron armlets enchanted to further aid their struggle to remain on this world (see page 151 of the *Fiend Folio*).

Shadar-kai hunt and eat much as many humanoids do. With their bodies numbed by the touch of shadow, they seek out the strongest flavors and tastes they can find. Even the most powerful spices seem bland and distant to the shadow fey, though, and few take to food with any joy. For shadar-kai, eating is but another reminder that they will someday be drawn into shadow.

PSYCHOLOGY AND SOCIETY OF THE SHADAR-KAI

The shadow fey were never great in number, raising only a handful of small hidden cities even at the height of their numbers. Once the shadow curse took hold the shadar-kai's sparsely populated holdings began to empty and decay. Now, what shadar-kai redoubts remain are elegant half ruined dwellings cut into the sides of shadowy cliffs and slender towers rising beneath the densest forest canopies, home only to the oldest and most crazed shadow fey.

In the centuries since the fall of their homes, the shadar-kai have lived on the fringes of other societies, clustered in small groups and cabals, often led by skilled shadow mages. These groups of spies, assassins, and the occasional spellcasters haunt the shadows, hunting for any means of escaping the shadow curse. Rarely numbering more than fifty members, they steal what they need to survive, eagerly attacking any humanoids they encounter along the way.

ADVANCED SHADAR-KAI

Desperate to make the most of their dwindling numbers, shadar-kai frequently train as assassins, rogues, and deadly shadow dancers. The most cunning of shadar-kai society take up the mantle of the shadow mage, wizards skilled in the arts of illusion and darkness. Some even adopt the shadow adept (see *Player's Guide to Faerûn*), daggerspell mage, or shadow-mind prestige classes (both from the *Complete Adventurer*), giving them far greater control over darkness and their enemies' perceptions.

Despite the bloodthirstiness they indulge upon others, shadow fey bands are savagely loyal to one another, like traumatized siblings clinging to their orphaned brethren. Passions run deep between shadar-kai, but the heights of tenderness this might manifest as in some races

instead gives rise to masochistic relationships, sometimes between merely two individuals but just as likely incorporating an entire band. These affairs culminate in agonizing orgies of tattooing, piercing, scarification, and mutilation. Yet, despite their painful nature, these trysts prove just as

Gal-Ralan

intimate and cherished to the shadar-kai as do the romances of other races.

As passionately as shadar-kai guard one another, centuries of loss and festering anger have left the shadar-kai intent on taking revenge on the civilized races that drove them to their doom. That the shadar-kai brought the shadow curse upon themselves is of little import to the cunning hunters and devious adepts of the shadow fey. It was the pain of nature giving way to younger races that caused the shadar-kai to seek aid in shadow and it is those younger races that the shadar-kai blame for their curse.

Regardless of their lack of race-wide organization, the shadow fey have universally adopted the spiked chain as their weapon of choice. Both a tool and a symbol of their wrathful crusade against the younger races, the shadar-kai delight in the spiked chain's versatility to mete out a variety of painful deaths, from brutal strangulations to slowly carved mutilations. As such, all shadow fey are skilled in the use of these weapons.

ENEMIES AND ALLIES OF THE SHADAR-KAI

As a result of their attempt to radically alter the natural world, even if just to protect it, shadar-kai are not well liked by other fey. While the shadar-kai still respect and honor their people and their courts, the shadow fey have been disowned from the hearts and minds of their brethren. As such, the shadar-kai have little to do with other

fey, instead utilizing a wide variety of other shadowy creatures in their plots.

While shadow mastiffs most commonly appear alongside shadar-kai hunters, shadow asps (see the *Fiend Folio*) and creatures with the shadow template (see the *Manual of the Planes*) might also be trained to serve the shadow fey. Powerful shadow creatures, like darkweavers (see the *Fiend Folio*), shadow dragons (see the *Draconomicon*), and shadow fiends (see the *Book of Vile Darkness*, mature audience only) have also been known to bend shadow fey to their whims, at least for a time. Shadar-kai ally with humanoids only when it serves some greater purpose or to eventually betray and steal from them.

Of all the fey, only the murderous redcaps (see the *Monster Manual III*) willingly have dealings with the shadar-kai, but only out of their wild bloodlust and not out of any sense of kinship. Embodiments of rage and natural bloodletting, redcaps eagerly indulge the shadow fey's fall into frustration and revenge. Sadistic voyeurs, redcaps flock to groups of shadar-kai, opportunistically hoping to bathe themselves in the vengeful ways of shadow fey warriors.

Despite their overlapping tactics and abilities, dark ones (see the *Fiend Folio* and "The Ecology of the Dark One" in *DRAGON* #322) and shadar-kai share a violent hatred of one another. While the dark ones revile the shadow fey out of jealousy and their isolationist tendencies, the shadar-kai seem to hold a deeper grudge. Some researchers speculate that this hatred perhaps ties to some new shadar-kai revelation of the

future or the dark ones' own inscrutable connection to the Plane of Shadow. Others, however, hold that the dark ones' mysterious history might lie with the ancient mortal heroes who thwarted the shadar-kai adepts' dark ritual so long ago and that a potent racial enmity remains.

SHADAR-KAI TACTICS

As skilled as they are stealthy, many of a shadow fey's opponents never even see their attacker, at least not until they're restrained for a protracted and agonizing revenge.

Advanced Ambushers: Both cunning and stealthy, the shadar-kai use their hide in plain sight ability to launch surprise attacks whenever possible, appearing and sneak attacking only to melt into the shadows. The shadar-kai regularly repeat this tactic, dropping foes one by one over the course of multiple ambush encounters, each lasting little more than a single round. Such ambushes most commonly occur in shadowy surroundings as shadar-kai gain a significant bonus to hiding in such areas.

Cursed Combatants: Above all things, shadar-kai fear the shadow curse. Forced to make DC 15 Will saves or suffer negative levels whenever they are stunned, dazed, staggered, or unconscious, shadow fey adepts constantly seek out spells like owl's wisdom and magic items like cloaks of resistance, periparts of Wisdom, various ioun stones, and similar saving-throw augmenting and Wisdom-bolstering magics. Shadar-kai swiftly flee from opponents, making use of spells such as daze, sound burst, or word of chaos that capitalize upon this failing. ☐

The Ecology

of the Shade

Outcasts in a shadowy world

by Dan Salas

The sleeping chamber was filled with shadows and formless black shapes. On the bed slept Carissa, the Lady of Graham Manor. Her young face was faintly lit by starlight from the single bedroom window. Until midnight, she slept undisturbed, exhausted from the day's events.

Suddenly she sat up, her wide eyes peering into the darkness. The change from dreams to shadowed reality was startling. Lady Carissa knew that she was a light sleeper, but only some nearby disturbance could awaken her so violently. The silence and blackness of the chamber only increased her nervousness. With damp hands, she reached over to her bedside table and spoke the words of a simple cantrip to light a candle. The small yellow flame did not completely drive away the darkness, but it was better than nothing. A wizardess had been able to teach her that much.

Carissa looked around as her eyes adjusted to the pale light. She saw the familiar furnishings, thick carpets, purple dragon sculptures, bright tapestries, and silk bedsheets. The heavy stones of the walls seemed to reassure her that the fortress was still strong. Then her gaze found the intruder, and she froze.

A man sat motionless in a chair across the room, dressed in gray and black. His face was partially covered by a black cloth wrapped around his jaw, and his eyes were hidden in the shadows of a black hood. He seemed more like a phantom than a man. Though his posture was not threatening, Carissa stared at him with a paralyzing fear. If she shouted for help, would anyone arrive in time? Was he an assassin?

The intruder held up one gloved hand. "Please don't call the guards," he said softly. "I've come to help you, not harm you."

Carissa's brow wrinkled. She thought that the voice sounded familiar, but she did not recognize the stranger. Being the lady of a large and powerful estate, she was even now recovering her wits and sense of command. She was on her own. "Who are you?" she whispered fiercely.

For a moment, the intruder did not answer. During this silence, Carissa noticed the dagger strapped to his thigh, the long sword at his side, and the studded leather vest under his dark cloak. Seeing that he was a warrior and not a night-demon, she gave him a steadier look.

"Tonight, I'm an advisor," he finally said. "I'm here to tell you about the man who wounded your beloved, Lord Graham."

Carissa perceived bitterness in the intruder's voice as he spoke the name of her husband. She did not understand his indignity, so she ignored it, trying to think clearly. "How do you know about my lords wound?"

"Right now, he lays in the chapel with your clerics. He'll live, this time. But you'll

need to know more about his attacker if you're to keep your husband in this world."

Carissa was taken aback. Maybe he was a spy. "You seem to know much."

"Then hear my words. Lord Graham's attacker is not a demon, nor is he a normal assassin. Your enemy is a shade."

A childhood tale drifted up from memory. "A shade?"

"Yes. Once a man, but now a creature of darkness. A shade is a person who has traded his soul to gain a permanent connection to the Plane of Shadow. There, the Positive and Negative Material Planes meet in the shadow of the Prime Material Plane. Do you understand what I mean?"

Carissa nodded, fascinated. She was a scholar as well as a noble, and her interest in the metasciences was drawn out by the mysterious intruder.

"A shade receives effects from the Positive and Negative Planes," he continued.

"From the Positive, he receives immunity from aging and disease, as well as powers of healing. To the Negative Plane, he loses his soul. His appearance becomes dark as night, and his personality becomes even darker."¹

"Who would do this to himself?"

The stranger chuckled sarcastically, sadly. "Anyone who finds no joy in daylight and who cares nothing for the company of others. Anyone who would gladly trade his soul for the powers of the night."

The stranger slipped into brooding silence. Feeling awkward but less afraid, Carissa asked, "How is it done?"

"There are some clerics who will make the transformation for a price — usually 3,000 gold pieces.² I don't know the exact spells that are used, but I know that the person must be brought to the Plane of Shadow, where the cleric . . . slays him and makes the transformation.³ The person is then a shade. He can never again be returned from the dead because he has no soul, no spirit. He cannot increase his skills.⁴ He cannot have children."

"There must not be many such people in the world."

Table 1
Shade Character Class

Die roll Character class

1	Cavalier
2-7	Fighter
8-10	Magic-user
11-12	Illusionist
13-17	Thief
18-20	Assassin

Table 2
Shade Alignment

Die roll Alignment

1-2	Lawful neutral
3	True neutral
4-5	Chaotic neutral
6-7	Lawful evil
8-9	Neutral evil
10	Chaotic evil

Note: Reroll result if it is inconsistent with the assassin character class.

"No, not many. The sacrifices are too great for most people to accept. But there are some . . ." ⁵ The stranger's mind seemed to wander as he spoke. Carissa listened attentively, unsure of the truth of his story, and increasingly doubtful of his sanity. "Not all shades are evil in nature, but none of them are actually good. The ones who changed from good alignment sometimes seek revenge against those who caused their misery. Lawful shades usually continue their war against chaos. Evil shades usually continue their war against everyone."

As the man's voice drifted off, Carissa decided to change the course of the conversation. "You were talking about my husband's attacker. . ."

"Yes, of course." The stranger seemed to regather his thoughts, and he spoke with new energy. "The attacker's name is Var-

ian. This shade came to me four days ago and asked that I help him kill Lord Graham. He seeks vengeance for some personal reason. I refused his offer."

"How do we fight him?"

"Light is your best weapon. In bright light, a shade becomes weak, and is more vulnerable to magical attacks. Have your clerics cast continual *light* spells on lanterns. Leave no passage unlit that leads to your lord. In the shadows, a shade can transport himself to the Plane of Shadow, so you must keep Varian in bright light or in complete darkness. As a last resort, use a *holy word* to force him to return to the Plane of Shadow.

"Varian himself remains on the Prime Material Plane during daylight. He sleeps in the ruins of Thurid Castle. There you can trap him and kill him."

Carissa nodded. "If your words are true, you'll be richly rewarded."

The man snorted in disgust. "I don't want your gold."

"Then why have you helped us?"

The stranger sat in silence, his vision fixed upon her. Then he stood and walked slowly toward her. Carissa shrank back from him, preparing to call for the guards, but the intruder made no move for his weapons. Instead, he sat on the edge of the bed. Still, Carissa could not see his eyes.

"I've helped Lord Graham because I know that his death would ruin you. I don't want any harm to come to you, Carissa. I still love you, even more than I did ten years ago."

Suddenly she recognized his voice, recognized the figure under the black clothes, recognized his manner of moving and speaking. Her heart jumped and she cried out, "Dimitri!"

The man leaned toward her and extended a hand. With wild joy she moved closer to him, but then he grasped the candle flame and crushed it. Shadows filled the room again.

Her heart racing, Carissa waved a hand in front of her. Dimitri was not within reach. As she frantically relit the candle with her last cantrip, she thought of Dimitri: a lost lover from her past, an honorable man whom she had loved deeply before her father had wed her to Lord Graham. Her thoughts were dazed and tangled as the candlelight returned.

She looked quickly around the room, but Dimitri was gone. Carissa knew that he would not be back. In the silence of the flickering candlelight, Carissa covered her face with her hands and wept.

Notes

¹ A character who becomes a shade takes new personality traits, becoming sober, moody, cynical, and suspicious. Because of these traits, the character's charisma drops. To determine the exact penalty, divide the character's charisma score by three (rounding down), then

Elysian Field® Mapping Accessories

Elysian Field® Flexible Overlay 25" x 37" transparent sheet with light or dark lines.
Available Patterns: 2" hexes, 1" hexes, 21mm hexes, 16mm hexes with coordinates, 1" squares, 20mm squares, combined 1" squares & 0.8" hexes
\$6.95 each

Transparent grid patterns turn any map into a scenario.
● All markers come off clean including "permanent" ones.
● Large variety of available patterns: hexes, squares and our special combination of both.
● Catalog includes includes paper, markers, clips, blank overlays, Area-of-Effect cutout sheets, etc.
● Dealer inquiries welcome.

Elysian Field® Backpack Board 12" x 18" Clear, rigid board with light or dark lines.
Available patterns: 1" hexes, 0.8" hexes, 1" squares, 0.5" squares, staggered 1" squares combined 1" squares & 0.8" hexes
\$8.50 each or 2 for \$15.00

TO ORDER: Choose light or dark blue lines and pattern. Include \$2.00 for shipping (\$4.00 in Canada). In Illinois add 7% tax. Send money order or check.
OR FREE CATALOG: Send self-addressed, stamped business envelope.

Send to: Britton Designs
5131 S. Blackstone Ave.
Chicago, Ill. 60615

subtract this number from the original charisma score to get the new charisma score.

The character's comeliness drops due to his new appearance: dark eyes, gray skin, black clothes, etc. Determine the comeliness penalty in the same way as the charisma penalty. Only drow elves are immune from the comeliness penalty, since the change in appearance leaves their skin no darker than before, and only affects their eyes and hair color.

² No cleric of good alignment will turn a person into a shade, whether the person is willing or not. A neutral-evil cleric is 50% likely to intentionally kill the character during the process, and a chaotic-evil cleric is 75% likely to kill the character. To perform the transformation, the cleric must be at least 10th level.

³ The process for becoming a shade begins on the Prime Material Plane, where the would-be shade drinks lethal poison and dies. The cleric then uses *plane shift* to transport himself and the character to the Plane of Shadow. There, the cleric casts *neutralize poison* on the character, and then *imbue with spell ability* if the character is not a member of a spell-casting class. The cleric then casts *negative plane protection* to allow the forces of the Positive and Negative Material Planes to enter the character's body, thus causing the physical, psychological, and magical changes. At last, the cleric casts *raise dead* (this spell even works on elves and half-orcs due to the interference of the energies from the Positive and Negative Material Planes). The character must make a successful resurrection survival check or die again — permanently.

The character now needs to recover, as noted in the description of the *raise dead* spell. Afterwards, he is a full shade, complete with special powers, special abilities, and all other effects as explained in the *Monster Manual II* and in this article.

⁴ A shade cannot gain experience points, cannot increase in class level or proficiency, and cannot gain new levels of spell ability. The mixture of the Positive and Negative Material Planes holds the shade forever at the same class level, also making him immune to magical increases or decreases in level.

⁵ For the class of a random shade, roll 1d20 on Table 1. For the shade's alignment, use Table 2; roll 1d4 + 6 for assassins, or 1d10 for other classes. The shade's level and equipment should be chosen in accordance with the PC party's strength.

The ability scores of a shade can be determined by the chart on page 74 of *Unearthed Arcana*. Note that the charisma and comeliness scores need to be adjusted as with any other character who has become a shade.

When determining the experience-point value of an NPC shade (*Dungeon Masters Guide*, page 85), consider the shade status to be an exceptional ability.

Presenting:

The Fantasy Greeting Collection Series:
CHRISTMAS CARDS — 1987
RUDOLPH THE RED NOSED DRAGON

Seen here in black & white, these full size 5" x 8" **FULL COLOR** Christmas Cards are packed 10 to a box and come blank on the inside for your own personal fantasy greeting. They are available for only \$9.50 per box, plus \$1.45 shipping & handling per box.

Using only high quality paper, this limited edition printing is reproduced from the original Oil Painting "Rudolph the Red Nosed Dragon" (as seen at the GEN CON® 20 Game Fair's Invitation Fantasy Art Show) by Seth Dembar.

ORDER TODAY TO RECEIVE IN TIME FOR CHRISTMAS MAILING.

To order, fill in the order form below and mail today!

Fantasy Greetings, PO Box 184, Brooklyn, NY 11223

Please send me _____ boxes of the Fantasy Greeting Collectors Series: Christmas Cards — 1987, Rudolph the Red Nosed Dragon at \$9.50 per box + \$1.45 shipping & handling per box. NY residents please add 8.25% sales tax. International orders, please add \$4.00 per box for air-mail. U.S. funds only. Please allow 2-4 weeks delivery and Merry Christmas to all.

Shambling Mound

“Humans call them shambling mounds or shamblers, a descriptive if not too imaginative name, but if they have any name for themselves, no one has ever heard it. Horrific in appearance and often savage in aspect, shamblers are no mere dumb brutes, attacking with cunning and stealth and withdrawing into the deepest, darkest mires. Though dimly intelligent, their thoughts and motives are entirely alien, as is their bizarre physiology, and even what passes for their society when these abominations band together around great wetland mounds for purposes beyond imagining. Yet there is something strangely familiar about them...”

—Jathalara Varenthis, elven druid-sage

Easily dismissed as mindless plant creatures, shambling mounds are actually intelligent and capable of forethought and planning. Blending perfectly with their swampy environs, they are able to evaluate a target's strength, ambushing easy prey and quietly letting more dangerous creatures pass. More than once a heavily armored warrior has safely walked across a shambler's prone form, mistaking it for a hillock rising out of the marsh, only to hear the screams behind him as the monster grabs his trailing wizard or rogue ally.

OVERVIEW

Shambling mounds are almost universally disliked by every intelligent race, hated and feared not for their cruelty but for their remorselessness. They are a force of nature—a living storm of verdant flesh that rains death upon the just and unjust alike. Even animals, plants, and vermin are not safe from their predations. They are known to be intelligent, after a fashion, but rarely can they be reasoned with, bargained with, or even conversed with, and their cunning only makes them more dangerous. Blending

in as they do with the environment, they could be almost anywhere at any time, attacking without warning and not caring whether they leave survivors, so long as they acquire their next meal. Whether in the wilderness or in caverns beneath the ground, any pile of rot and fecundity, or any algae-filled backwater or ocean sargasso, might easily conceal a shambler lying in wait. Travelers' tales speak of the normally water-loving shamblers inhabiting even the driest of deserts; perhaps only the mountain peaks and high ice of the frozen north are free of their scourge.

Disturbing rumors persist of shamblers gathering in strange aggregations around great earthen mounds in the depths of marshes and jungles, and sages have long wondered whether there is some alien purpose at work. None have succeeded in conversing with these gathered shamblers, and the far more common solitary hunters seem to have no knowledge of the affairs of their brethren.

Many have speculated on the origins of this curious creature. While the existence of intelligent and carnivorous plants is no great mystery, the shambling mound is a puzzle indeed. Why is it so resistant to fire? Why the strange affinity for lightning? Why, as a plant, does it have a *brain*? Some sages theorize that the shambler is a product of fell sorcery, a strange mutational byproduct of uncontrolled magical residues, the realization of druidic experimentation in a new form of plant life, or perhaps a natural evolution of carnivorous plants. In truth, none of these are correct.

ECOLOGY

Shambling mounds are strange creatures, more akin to an animate tangle of creeping parasitic vines than a single rooted plant. They are omnivorous, able to draw their sustenance from nearly anything, wrapping their creepers around living trees and drawing forth their sap, sending rootlets into the soil and drifts of rotting vegetation and sucking up raw nutrients, or even sinking their tendrils into deadfalls, snags, and logs to extract worms, insects, and other vermin by the hundreds from their nests. They are most feared, however, because of their affinity for flesh and blood. They are clever hunters, able to move with great stealth and lie for days on end without moving, waiting patiently for a potential meal, then lashing out with terrifying suddenness and catching their prey in their crushing grips. From there they literally pull the creature apart, drawing out fluids before breaking down flesh and bone over the course of days or weeks, leaving nothing behind.

Shambling mounds are actually parasitic hybrid creatures whose origins lie far from the civilized parts of Golarion. The explorers who discovered this place are unknown, but fragments of their journals have been found in waterlogged chests retrieved from Azlanti ruins. Among

SYMBIOTIC SWARM

Shambling mounds are themselves unpleasant opponents, but some shambling mounds live in symbiosis with swarms of insects, most often centipedes, skittering along the tendrils and vines that make up the shambler. Typically such a symbiotic swarm does not endanger creatures fighting a shambling mound, as too few of the centipedes run along the creature's surface to pose much of a threat. However, a target engulfed by the shambler's constrict attack is subject to the attack of a centipede swarm (MM 238), including physical damage, poison, and distraction. The swarm is considered to have total cover from attacks as long as the shambling mound is alive. If the shambling mound is killed, the centipede swarm boils up from its remains and attacks any creatures nearby. Add +1 to the CR of a shambling mound with a symbiotic centipede swarm.

the many places they sojourned, one they called "the Green Valley" seemed an idyllic setting, heavily overgrown with abundant forest and jungle, teeming with native fauna and yet seemingly easily tamed. The actual location of this place is lost—it might be another plane, a distant planet, one of the great Vaults of the Darklands, or possibly a pristine, untouched region deep in the Mwangi Expanse or a lush valley surrounded by snow in the Crown of the World. The explorers failed to realize that in this place they were an alien species, and an environment that appeared on its surface to be hospitable was far from it. Something in the area possessed a rudimentary sentience and awareness, and this strange intelligence perceived the intrusion of these visitors as a threat. Creeping vines embraced the travelers in their sleep, shedding psychoactive and mutagenic spores that infected the travelers' minds and bodies in an attempt to convert them into non-hostile symbiotic native lifeforms. Showing no outward signs of the psychic and physical seed growing within, the wanderers teleported freely back and forth to their home city, bringing back sketches, seeds, and other samples for further study.

Once they returned, however, a strange transformation began to occur. While in the Green Valley, the primal intelligence there slowed and guided the growth of the infecting spores; without this guiding mind, the impulses imprinted upon the seed took over and began to remake their hosts, mind and body. Many of those first explorers fled to the wilderness, partly out of an instinctive kinship for nature, partly in horror as the plant within began to devour and replace the flesh without. Humanoid features warped into twisted masses of vines and rot. Eventually, all semblance of the creatures they once were faded into a nightmare of vegetative horror, save their bipedal stance and vestiges

of their brains and nervous system. The remnants of thinking brains and fast-acting nerves transformed under the influence of the spores into a network of greenish-gray fibers of amazing conductivity and capacitance, enabling them to process and hold great stores of energy, rapidly dissipating excess heat and able to channel and store vast amounts of electricity. These brain-like plant fibers also retained a degenerated remnant of their hosts' minds, tortured with the tattered remains of their memories and dreams, and longing for communion with the now-absent intelligence of the Green Valley. These tortured creatures were the first shambling mounds.

HABITAT & SOCIETY

Shambling mounds are a strange amalgam of rootless parasitic plants, cursed with deeply ingrained instinctive drives and yet gifted with an inheritance of enough dim sentience to attempt to pursue these instincts, sometimes using bursts of creativity on the order of human-level intelligence.

Shambling mounds are primarily simple creatures, and their basic requirements are primitive and natural—sustenance, safety, and procreation. The first two are easily satisfied at a basic level, as shambling mounds are capable of drawing sustenance from decaying vegetable matter, from drifts of composting leaves and rotting trees to the fetid muck at the bottom of a swamp. Shamblers can also turn light into food in the manner of most plants, though their mass and activity level usually means this is insufficient for all their needs; likewise, they do not require light, and are equally at home amidst the fungi forests of dank cavern systems deep below the ground as they are on the surface. Few creatures consider them worthy of a meal, even if they dared to challenge their might, and the shamblers' ability to blend in with the natural landscape or hide underwater enables them to easily avoid those few who might prey upon them.

The fact that they can survive without hunting raises the question of why they do it at all, and the answer is found in the third basic impulse—procreation. The alien flora that birthed the shambling mounds is inherently parasitic, and cannot reproduce without animate living tissue. A shambler must consume vast quantities of flesh, blood, bone, and especially humanoid brain tissue, which it absorbs not so much for sustenance as to sprout new rootlets, cyst-like

tubercles, pulsing heartwood, and budded networks of plant-brain fibers. This last is what requires the greatest time and effort to create, both because its base components are such a small part of the body mass of its victims and because the high-capacitance tissue requires so much energy to be infused into it.

There is an exception to this limitation, and some shamblers have discovered it and in some way communicated this to their fellows. Elves, perhaps because of their inherent connection to nature or some link to the Green Valley, are a uniquely fertile medium for their growth—rather than having to grow an entirely new plant-brain out of digested matter, a shambler can directly convert an elf's brain and greater nervous system into plant-brain material, saving an enormous amount of time and energy. Where a shambling mound might need to consume literally a ton of humanoid tissue to bud an offspring, the fresh corpse of a single elf is sufficient for a shambler to create a full-size plant-brain, leaving only the (much less energy-intensive) process of growing the remaining body.

In any event, when a shambler has finally assembled enough stored base material to calve a new shambling mound, the “parent” finds a hiding place rich in vegetable matter and roots itself firmly, weaving and grafting the proto-shambler's vital elements into the available matter. After approximately a week, the new shambler detaches itself from the nest and leaves its parent behind. Within less than a day, the parent (now smaller by approximately a third) disentangles itself from the remains of the birthing mass and returns to its former activities. Each shambling mound is typically nomadic, wandering with the seasons and as it finds prey. Instinctively careful of overhunting a particular territory, shamblers tend to avoid each other. Chance encounters between them are rare, and shamblers usually ignore one another when they do meet.

Rarely, a shambler may possess an empathic affinity that draws other shamblers to it and enables them to work in concert. Some collections of shamblers simply repeat their usual imperatives on a larger scale, but others have a deeper purpose, trying to establish a connection with the foreign plant intelligence that created their forebears. They may seek this connection through meditation or through destruction of civilizations that they feel impede nature's ability to grow and thrive in its fullness. Some

shambling mounds engage cooperatively with intelligent creatures that can communicate with plants.

CAMPAIGN ROLE

Shambling mounds are excellent stealth and ambush predators in caves or wilderness, particularly where water or vegetation (or both) are present. While not brilliant, shamblers are far more intelligent than most simple brute monsters and should be cunning and canny enough to attack, retreat, and use terrain to their advantage. A shambling mound is a horrifying change of pace as a “moat monster” around a ruined keep or in an underground lake. PCs could come across a newly calved shambling mound and defeat it, only to have its parent rise the next day and begin hunting them.

A shambling mound might ally with druids or with intelligent races (such as lizardfolk) that venerate it or grant it offerings, while members of any race might beg heroes for help against a shambling mound preying upon their people. Sentient plant or fey creatures like dryads and treants might likewise request aid in ridding their forests of such a dangerous parasite, while an exceptional shambler may have discovered how to parasitically dominate such creatures and turn them to their cause.

TREASURE

Shambling mounds are uninterested in treasure. What few baubles they keep are typically durable inorganic objects left over from their consumption of intelligent creatures. Fragile items end up smashed to pieces in their ungente clutches, while organic items not torn apart or consumed by the shambling mound inevitably rot and decay swiftly in the muck and mire where shamblers live. As shamblers are usually nomadic, they rarely keep a lair in the traditional sense, so any coins or goods found nearby are generally from recent victims, or (rarely) lodged within the shambling mound’s body mass, tangled amidst its tendrils.

VARIANTS

The majority of shambling mounds live outdoors, most commonly in marshes, swamps, jungles, and well-watered forests. A shambling mound may have one or more of the following variant abilities.

Compressible Form (Ex): These shamblers are difficult to harm with piercing or bludgeoning attacks, gaining DR 10/slashing and taking half damage from falls. A compressible shambling mound also never suffers penalties for squeezing into a 5-foot-wide space, and gains a +10 racial bonus to Escape Artist checks (+10 for squeezing through a tight space).

Communion with the Green (Su): This variety of shambling mound is instinctively attuned to the essence

STORMSTRUCK SHAMBLER

You have been lashed by the power of the storm so many times that you retain a powerful affinity for it, able to draw upon your reserves of energy to strike enemies with living lightning.

Prerequisite: Shambling mound, must have been struck by lightning.

Benefit: As a free action, you may charge one of your limbs with electricity equivalent to a *shocking grasp* spell, dealing 5d6 electricity damage to a creature you touch, attack with an unarmed strike, or grapple. If making a touch attack, you get a +3 to your attack roll if the target is wearing metal armor. Each time you use this ability, you take 1 point of temporary Constitution damage; you regain these lost Constitution points at a rate of 1 per hour. You may use this ability a number of times per day equal to your hit dice.

SHAMBLING MONOLITH

You are able to draw up available vegetation into your body mass and increase your size and strength.

Prerequisite: Shambling mound.

Benefit: As a full-round action, you may draw additional vegetable matter into yourself and increase your size, strength, and durability as if using an *animal growth* spell. At the beginning of each turn, you must succeed at a Fortitude save to maintain your increased size. The save DC is 10 if in forest or jungle and 15 if in a swamp or underground, and increases by 1 for each round that passes. If you fail the save, you collapse back to your normal size and are fatigued for 8 hours.

Special: You must be in forest, jungle, swamp, or underground terrain to use this feat. You cannot use this feat when you are fatigued or exhausted.

of nature. It gains a +4 bonus to Charisma-based checks with plants and animals and gains the following spell-like abilities (caster level 8th): At will—*detect animals or plants*, *speaking with plants*; 1/day—*barkskin*, *blight*, *command plants*, *diminish plants*, *entangle*, *goodberry*, *plant growth*; 1/week—*commune with nature*. The saving throws are Wisdom-based.

Greensward: The most tragic variant shambler is outwardly identical to a normal shambling mound (though they often fashion some of their body mass into a makeshift head and face). They are extremely rare humanoids (usually elves) whose minds, spirits, and consciousnesses have somehow endured and remained intact after a shambling mound kills and eats them. Lacking the power of speech, many are slain by their humanoid comrades as they return home in hope of a cure, but some few have managed to avoid hostilities long enough to manage

SUFFOCATING STRANGULATION

Your constriction attack forces the air out of your victim's lungs and leaves him helpless and gasping for breath.

Prerequisite: Improved grab, constrict

Benefit: By making a successful grapple check, you are able to coil your natural weapons around an opponent's throat (or other breathing apparatus), crushing the breath out of him. The opponent cannot hold his breath and must immediately begin making Constitution checks at the end of his turn each round, starting at DC 10 and increasing by 1 each round. Failure indicates he falls unconscious at 0 hit points. Once the opponent is unconscious, you may choose to either damage him (requiring a grapple check) or continue to suffocate him (no check required); if you maintain the chokehold, on your next turn he drops to -1 hit points and is dying. If you maintain the chokehold on the following turn, he suffocates and dies.

Creatures that do not need to breathe are unaffected by this ability.

peaceful communication. Those unable to secure a *miracle* or *wish* to return to their own form have sworn to use their new forms to become defenders of the woodlands. Greenswards are usually chaotic good. They retain the memories of their previous life, but they cannot speak or cast spells. A greensward's Intelligence is +2 higher than a common shambling mound. (CR +1)

Spore Mound: Some shamblers live in such close association with fungi and rot that they gradually become infested. These spore mounds look much like typical shamblers but are encrusted in morels, puffballs, and all manner of mushrooms. Whenever a spore mound is struck in combat, it discharges a cloud of yellow mold spores in a 10-foot radius (inhaled poison; Fortitude DC 15, initial damage 1d6 Con, secondary damage 2d6 Con). If exposed to direct sunlight, a spore mound's yellow mold is rendered dormant and does not discharge. Its spore discharge is suppressed for 1 round if the creature is struck by a fire attack that overcomes its fire resistance. (CR +1)

Tanglethorn Mound: Found only in arid regions, deserts, hills, and dry plains, tanglethorn mounds look like twisted masses of dry, thorny vines wrapped thickly around misshapen clumps of cacti. They deal slashing, piercing, and bludgeoning damage with their slam and constrict attacks, and their constrict attacks deal +1d6 damage. Tanglethorn mounds lack a swim speed but have a burrow speed of 10 feet and tremorsense out to a distance of 30 feet; they often lie in wait just below the surface, or with a portion of their body mass showing above ground, appearing like a normal thorny bush or cactus. Their racial bonus to Hide checks applies only in desert settings. (CR +1)

SHAMBLING MOUNDS ON GOLARION

Shambling mounds have their origin with Azlanti explorers (or a rare alliance of Kyonin elves and Azlanti humans) who journeyed either to a primordial place on Castrovel—the Green Planet—a demiplane in the Ethereal Plane, or a remote region in Golarion, unwittingly bringing the seeds of their transformation back with them. Most shamblers on Golarion are solitary and nomadic, but there are several significant exceptions. In southern Kyonin, hundreds of shamblers have gathered under the banner of the demon Treerazer. It is unknown if he was the one who discovered the shambling mound's special affinity for creating spawn from elves, if one or more exceptionally intelligent shamblers discovered the link and offered their services to the great demon in hopes of exacting revenge upon the elves, or if they allied out of the belief that the demon can help them return to the Green Valley. PCs in Kyonin and surrounding lands might be surprised to find shambler shock troops intermixed with Treerazer's legions and minions.

Some shamblers eternally hunger for that lost sense of primal communion that instinct tells them was once theirs, casting their eyes to the skies, recognizing the green "star" Castrovel as significant, and pining for their lost home (whether or not that is actually their place of origin). Most, have no conscious recollection of the Green Valley, but nonetheless carry a terrible longing for the thing that was lost and a burning hunger that they must reach it once again for them to be made whole. These shamblers instinctively feel that to be at peace, they must build a community of plant-creatures on Golarion, awakening nature's heart and soul. To do this, balance must be restored, quelling all disruptions to the natural world and excising the tumors of civilization that wrack the health of the living planet.

The largest collection of shambling mounds, numbering in the thousands, lives in the Sudden Lands and the Mwangi Expanse. There, an exceptional shambling mound druid known as Zandghoreishi ("the Jade Prophet") has drawn great numbers of shamblers to his call. He has proclaimed that the annihilation of the nations of Lirgen and Yamasa and the flooding of their lands was but the first part of a cleansing wave that will clear the way for the planet's awakening. Large groups of shamblers have attacked and utterly destroyed many settlements throughout the region, and in each place they have formed the detritus of the devastated communities into large mounds in intricate shapes and forms. Whether these are intended as foci for primal natural energy or serve some stranger purpose is unknown. Thus far, the deserts of Garund appear to have contained the spread of the Jade Prophet's message and minions but there is quiet concern among some sages of the southlands as to the threat he might pose.

SHAMBLING MOUND

Rising up on two trunk-like legs, a deliquescent mass of tangled vines drips with slime, reeking of rot and fresh-turned earth as it lashes out with tendrils like mooring ropes.

SPECIAL ABILITIES

Improved Grab (Ex) To use this ability, a shambler must hit with both slam attacks. It can then attempt to start a grapple as a free action without provoking an attack of opportunity. If it wins the grapple check, it establishes a hold and can constrict.

Constrict (Ex) A shambler deals 2d6+7 points of damage with a successful grapple check.

Immunity to Electricity (Ex) Shamblers take no damage from electricity. Instead, any electricity attack (such as *shocking grasp* or *lightning bolt*) used against a shambler temporarily grants it 1d4 points of Constitution. The shambler loses these points at the rate of 1 per hour.

Skills Shamblers have a +4 racial bonus on Hide, Listen, and Move Silently checks. The racial bonus on Hide checks increases to +12 when in a swampy or forested area.

ECOLOGY OF THE SHARN

by Brian R. James

illustrations by Eva Widemann

Lyrna could suppress her tears no longer. She wasn't the only one overcome by the senseless devastation around her. Others in the procession openly wept at the blighted sore their homeland had become. Where once stood rolling hills wreathed in verdant foliage now stood barren moorland—twisted and inimical to life. Behind her, the walls of Myth Akherynnar faded away into the cloying mists. She, the last scion of House Fathomlin, understood her duty well, yet the young elf knew in her heart it would be the last time she would set eyes upon the shining capital.

Whispering a prayer to the fey spirits, Lyrna tightened the grip on her staff and quickened her pace. With the blessing of the spirits, the elves would reach the Tosofome Caldera by dawn of the third day. There they would initiate the high magic ritual that would drive the Killing Storm back from whence it came—to the boughs of Aryvandaar.

The hiss of acid rain driven hard against her protective wards drew Lyrna back to the present. Looking around, she was momentarily shocked to discover she was no longer among the procession. Eyes widening, she saw that she was standing among the shattered ruins of Faer'tel'miir, ninety miles to the north. Yet how could this be?

Shock turned to mute horror as an oily abomination from out of her nightmares materialized from the wall before her, three eel-like heads turning to regard her despite their lack of eyes.

"Miyeritar is lost," intoned three distinct voices. "But through us your civilization can endure."

Lyrna found her voice at last, issuing a full-throated scream as oily black goo seeped up from the ground to engulf her.

LEGEND AND LORE

Sharns are an enigma little understood by sages and rightfully feared by adventurers. Born of the last remnants of a dead world, these timeless beings embody raw eldritch might. They might rise to rule the mortal world, if they cared and could put their minds to it, but their agenda seems more sophisticated than temporal wealth or power. Their motives are alien and ever shifting. Some dare claim the sharns are insane. Sharns assert that what others call insanity is actually enlightenment.

ORIGIN OF THE SHARNS

Most aberrant creatures seem to lack coherent explanation, and the sharns are no exception. Long has their origin been shrouded in mystery, for the sharns never speak of it to nonsharns and no divination illuminates the truth. Some scholars cite the aberrant physiology and strange magic of the sharns as evidence of their link to the Far Realm. Yet the truth of their creation is more bizarre and complex than a mere link to the Outside.

Here the true origin of the sharns is revealed. Such truth is perilous lore indeed. Many have lost their sanity in an attempt to comprehend matters anathema to the mortal psyche.

THE SHATTERING

Somewhere at the dawn of the cosmos, the elder god Tharizdun stretched forth his hand to clutch a shard of utter evil. This simple act exposed creation to the perverse remains of another universe that evil had destroyed. The power-hungry god was doomed to an eternity of madness, his mind shattered and scattered into other realities.

In one reality—the “true” universe known to mortals today—Tharizdun carried the crystalline

fragment into the heart of the primordial vastness and planted it there, giving birth to the Abyss. This act awakened the elder primordials to the burgeoning power of the gods, and soon war raged across all creation. Tharizdun was ultimately imprisoned for his effrontery, and the gods gained the upper hand against the primordials. Since that time, the universe has enjoyed at least the seeming of an uneasy peace.

THE END OF ALL THINGS

How different might the world be today if the primordials had won the Dawn War instead of the gods? In such a world, would Tharizdun have avoided imprisonment to carry out his mad scheme to unmake the universe? Such a universe does exist. On the surface, it seems little different from our own, but peer a little more closely, and it quickly becomes apparent that something has gone horribly wrong.

All that remains as a devastated world drifting within a decaying corpse of a universe. Skeletons of buildings, cities, and whole civilizations dot this world of dust and twilight. Jagged bolts of lightning illuminate the gray vault of the sky, born from ink-black clouds that circle the decaying world like stalking predators. Above the world hangs a feeble, collapsing sun, ringed by a halo of utter darkness.

Here Tharizdun's will is manifest in a world whose fate is dust and death. Between the booming thunder, the roar of unquenchable fire, and the violent cracking of the brittle earth, ethereal whispers echo from the void. These haunting wails emanate from the sharns, the last beings to bear witness to the end of all things in their version of creation.

BIRTHED OF DOOM

The sharns alone stand sentinel over this world of bones and ruins. Having achieved his ends, Tharizdun abandoned this universe eons ago. So mighty

EVOLUTION OF THE SHARNS

The sharns are the original creation of Ed Greenwood, and they appear briefly in the acclaimed AD&D® 2nd Edition adventure boxed set *Ruins of Undermountain* in 1991. Subsequent supplements, including *Netheril: Empire of Magic*, paint the sharns as adversaries of the malevolent phaerimm; the sharns' primary motivation was to prevent the abuse of magic and preserve the lore of doomed civilizations. In 2006, the sharns were central to the plot of the novel *Blackstaff* by Steven E. Schend, yet the true genesis of this enigmatic creature remained elusive. Now, in 2009, we bring the sharns into the core D&D® universe to share the spotlight with aboleths, illithids, and other memorable aberrant creatures.

had the mad god become that he shed his divinity in a grand apotheosis, becoming something beyond a god—something perverse and outside the known.

The sharns remained as the sentient remnant of all Tharizdun had destroyed and abandoned—a collective of merged consciousnesses. For a time, forsaken and alone on a dying world, this chaotic amalgam watched and waited. It's unclear whether curiosity or boredom drove it to act, but soon the roiling amorphous form of pitch-black “sharnstuff” began to move across the brittle landscape. Something within drove it to explore and catalog the dying world.

To speed its study, the sharnstuff formed manifestations in the likeness of the tripartite Juna, extinct eel-like beings whose ruined metropolises dotted the otherwise lifeless world. Knowing their time to be short, these sharns gorged themselves on all the knowledge they could consume. Within a few short years, the sharns had acquired thousands of magic implements unearthed around the globe. With the eldritch artifacts and the latent divine energy infused in their skin, the sharns attempted a ritual to escape

their doomed universe. They succeeded and arrived deep in the Underdark of the known mortal world.

As the sharns moved into the known world, transmuted rock sent a blizzard of black sand billowing forth from a tear in reality. From within that nimbus of purple light, out poured pools of ebony goo containing, here and there, bizarre creatures that were black with three eyeless heads and odd tri-clawed arms. Eldritch reactions created towering crystals, luminous and mysterious.

ELDER ELEMENTAL EYE

From his place of imprisonment, Tharizdun sensed the arrival of the sharns. He instantly knew these beings were of him and yet were not of him, and the paradox was delicious. With this fortuitous omen, the Chained God began a to call to the sharns. If they ever listen, who knows what could befall the world?

WORLD OF THE SHARN

The world of the sharns, and the universe that encloses it, exists beyond the known cosmology. This universe once held its own Astral Sea, Elemental Chaos, Feywild, and Shadowfell. After eons of unchallenged dominion by an alternate Tharizdun, only the mortal world remains, itself a shadowy hulk of its former self.

WORLD OF SHARN TRAITS

Type: Mirror world on an alternate mortal world.

Size and Shape: Spherical world; bounded.

Gravity: Normal, with regions of elemental buoyancy where the world has begun to break apart into the void.

Mutability: Normal.

The only known method for traveling between the world of Sharn and the known world is through planar breaches, which occur within the Sharnlands in the Godless Deeps of the Underdark. Sharns create, guard, and maintain such breaches jealously.

Through similarly great feats of magic, the sharns have halted the total dissolution of their home world. The arcane expenditure necessary to forestall oblivion is immense and ongoing. Sharn arcanists perform the rituals daily. For this reason, most sharns encountered in the Sharn world are younger sharns. These scouts acquire magic items and assimilate the knowledge of the indigenous population to sustain the preservation of their world.

SHARN LORE

A character knows the following information with a successful Dungeoneering check.

DC 20: The sharns live in the yawning depths of the Underdark in a region known as the Godless Deeps. There in the Sharnlands, the sharns live in great pools of black, amorphous goo. Immense caverns filled with intricate crystalline formations are common in this region, resembling the interior of a massive geode.

DC 25: Most elder sharns have retired to a state of eternal contemplation, leaving younger sharns to gather intelligence and defend the Sharnlands. These younger sharns take interest in the activities of mortals.

DC 30: Sharns are ancient aberrant creatures hailing from an alternate reality outside the known universe. Despite what most believe, sharns are not from the Far Realm.

DC 35: The sharns take their name from the dying world of their birth. Their signature tripartite form is an imperfect imitation of the Juna, an extinct species from the world of Sharn.

PHYSIOLOGY

Inquire about the sharns, and any sage on the world of Toril describes a bizarre creature with three eel-like heads and peculiar tri-claw arms. Yet this description does not represent the true form of this inscrutable being.

SKIN OF THE ANCIENT ONES

In their natural state, sharns exist as amorphous pools of oily black ooze. This semifluid “sharnstuff” is slimy and cold to the touch. Through a minor act of conscious thought, a sharn can alter its composition and viscosity to adopt a physical form. The resultant form has no fine definition and maintains its signature oily black appearance.

Lacking a pulmonary system, sharns have no need to breathe. If submerged, they can remain underwater indefinitely. In fact, the sharns have no internal organs to speak of whatsoever. Flesh, nerves, and blood are alien to their aberrant composition.

Unable to reproduce naturally, sharns require hosts to join with symbiotes. Such assimilated creatures shed their individuality to join with the greater sharn community. Once an individual merges with the sharns, the process is irreversible except under extremely rare and specific conditions. Typically, the host is a willing participant, but sharns do not shy from forcibly assimilating an enemy if the threat is dire.

Effectively immortal in their natural state, sharns have been known to while away the years without ever stirring from their dark pools.

MANIFESTATIONS

When a sharn manifests a corporeal form, it typically adopts its signature shape—massive tapered forms of amorphous flesh, jet-black and glistening as if coated with viscous slime and surrounded by a nimbus of

purple light. Their enormous bodies are studded with many tiny eyes that appear and disappear at random.

A sharn has three eyeless, eel-like heads, with large gaping maws filled with sharp, serrated teeth. The heads are capable of vocalizing, but sharns prefer their limited telepathic capabilities for communicating among themselves and seldom have a desire to speak with mortals. Some manner of arcane olfactory system grants the sharn a superior sense of smell.

Aside from its three heads, its peculiar limbs are another signature feature. These snakelike, flexible trunks end in an “elbow” where three humanlike forearms split apart from each other. Each arm ends in a humanlike hand topped with razor-sharp claws. Claws sprout and disappear along each of these bizarre appendages.

A sharn’s heads and arms connect to a single trunk ending in a thick tail. Its streamlined torso can glide as effortlessly through water as it does air. Despite its fearsome teeth and claws, a sharn prefers to remain at range and attack through *hex portals*.

The manifestations most likely to be encountered in the world are known as blackclaws. Other varieties exist including the phaseblades, hexshadows, and the exceedingly powerful and rare shiftshades. As the caretakers of the rituals maintaining their dying world, shiftshades are masters of arcane might. These sharns appear much the same as blackclaws, though their constant state of temporal flux makes them appear as if they are phasing in and out of reality (which isn’t far from the truth).

CULTURE

To outside observers, the sharns have a bizarre and alien culture. Sharn society is organized into subterranean communities called “pools,” with no concept of social classes and no hierarchy to speak of at all. They do not concern themselves with faith or piety, nor do they covet wealth or power.

Their society is a bedlam of philosophical argument and social intrigue. Power struggles, based on ideological conflicts, are constant. This inward-looking focus does not prevent sharns from becoming embroiled in the affairs of other species, even across the planes. Exactly what their agenda might be in such cases is rarely obvious and rarely unified.

The sharns all have the same broader world-view and share a physical appearance, but they can take different paths to achieve common aims.

When a sharn is slain, however, the individual consciousnesses, at least three of which each being possesses, are lost forever.

PSYCHOLOGY

Despite their homogenous appearance and telepathic abilities, sharns do not operate as a hive mind. Sharns share a group consciousness that is as fragmented as any intelligence can be. Unable to operate with a single-minded purpose, the goals of the sharn appear ever changing and often contradictory.

Though they possess a paradoxical nature, sharns can work together in harmony for short periods of time, whereupon they strive for the same goal while anticipating and complementing each other’s actions.

Spawned from a shared community, sharn manifestations are independent agents that can act upon their own desires and carry out their own agendas. Each manifestation has at least three entities, granting the sharns supernatural alacrity for decision-making. The more advanced a manifestation, the

more personalities it has. Multiple manifestations can act in concert, sharing a peculiar form of short-range telepathy among them.

A sharn fears little, but it is conscious of its own mortality. If a shiftshade is threatened with imminent death, it takes all avenues available to it to shift out of danger and return to its home pool. Each sharn represents the final legacy of a dead civilization, and the loss of even one sharn is a loss for the entire world.

Sharns have speak the language of madness, an inheritance of their origin. They can also speak any tongue known to their society when the need arises. When communicating with others, sharns commonly adopt complex multisyllabic names with little regard for the other's ability to pronounce it.

Their uniquely peculiar minds prevent attempts at mental contact unless the sharn wishes it. Those who have made such contact speak of a vast, turbulent ocean of consciousness upon which float tiny islands of individuality.

MAGIC

As beings from an alternate reality, sharns command strange magic unknown in the world today. The eldest sharns also employ unique items of power from their dying world—lesser artifacts brimming with alien power.

EARTH NODES

All sharns have a heightened ability to detect and activate earth nodes (see *FORGOTTEN REALMS® Campaign Guide* page 52 for details), but shiftshades take this mastery to a whole other level. Knowing exactly where these nodes are gives the sharns the appearance of having at-will teleportation powers. Their propensity for appearing and disappearing wherever and whenever they like makes sharns difficult foes to defeat.

HEX PORTALS

With fine manipulation of eldritch energy, sharns can create fissures in reality known as *hex portals*. Each portal is a small hexagonal window of light 3 feet in diameter that coalesces out of a swirl of purple motes. A sharn can maintain up to three of them at once, breaching nearly any ward or magical barrier. Opponents cannot attack a sharn through a *hex portal*.

ORB OF ENTROPY

In addition to earth nodes and *hex portals*, powerful sharns have created this item for use by allies and minions, detailed below.

Orb of Entropy

Level 28

The utter ruin manifest in Tharizdun's will swirls inside this globe of purest black. When activated, the orb is shrouded in a nimbus of purple light.

Lvl 28 +6 2,125,000 gp

Implement (Orb)

Enhancement: Attack rolls and damage rolls

Critical: +1 d8 psychic damage per plus

Power (Daily ♦ Psychic, Zone): Free Action. When you use a power that creates a zone, you can activate this power to make it so that any enemy that starts its turn within the zone is dazed (save ends). The body of any creature killed within the zone is immediately destroyed.

SHARN OF THE FORGOTTEN REALMS

"Hundreds of sharns sloughed off their shimmering black skins, and many Faertelmin stepped from the darkness to reclaim their lives as elves, humans, dwarves, centaurs, and others. Know there are yet sharn in the Realms. They choose to remain as Rhymanthiin's defenders as well as defenders against corrupt magic across the Realms."

ORIGIN

If the dark elves of Rhymanthiin are to be believed, the first sharns of Faerûn were in fact an inadvertent byproduct of the Dark Disaster—great killing storms sent against Miyeritar during the Third Crown War. As cloying mists and ichor-choked rains scoured the Great Sapphire Wood, three high mages led the last defenders of Miyeritar into the heart of the eldritch maelstrom to counter the dark ritual.

Indicative of their desperation, the high mages invoked the rare and perilous Ritual of Myriad, whispered to be legend even in the days before the Sundering. With unbridled magic pounding against defensive wards, the mages joined mind and body to birth the first *phaorn'quessir*—a giant-sized, tripartite being of immense power—to walk Toril in millennia.

Yet even as the *phaorn'quessir* moved to counter the eldritch bonds of the Killing Storms, something entirely unforeseen occurred. The eldritch bonds restricting the transformative magic to the high mages of the First Circle unraveled. Unfettered, lashing tendrils of wild magic quickly enveloped the Second and Third Circles as well. With nary a moment to scream, all ninety souls, the Last Defenders of Miyeritar, were themselves subsumed into the newborn entity.

With no arcane practitioners left to maintain the ritual, the *phaorn'quessir* began to dissolve under the onslaught of the killing storms. Through fissures in the limestone bedrock, oily black rivulets converged and flowed, forming deep black pools of amorphous goo in the lightless caverns of the Underdark. There the formless *phaorn'quessir* waited, its merged consciousnesses pondering the mystery of its existence as the centuries passed it by.

CUSTODIANS OF THE WEAVE

After slumbering for millennia, a discordant resonance in the Weave awakened the sharns and set them to their calling as custodians of the Weave. The Dark Disaster had burned an instinctive abhorrence to the abuse of magic into the sharn psyche. Magical devastation unleashed in Calimshan during the Shattering had cemented their resolve.

After that time, the sharns sent scouts throughout Faerûn to observe from the shadows, and when necessary, to strike out against those who would wield the Art for mass destruction. When the sharns couldn't prevent such atrocities, they sought to preserve dying cultures by permitting select individuals of the doomed civilization to join their collective.

The sharns' enmity against the phaerimm is well documented, driven by the latter's employment of *life drain* magic and the resultant desertification of the Anauroch.

PLAGUECHANGED SHARNS

The Spellplague changed most sharns, magical beings that they are. Their skin, once silver and black, now runs in metallic shades of blue. The typical nimbus of purple light now manifests as cerulean plaguefire dancing across their spellscarred bodies. The deep ebony sharn pools now bubble and writhe with cobalt radiance, agitated by wild magical currents flowing within them.

Worshiped as Spellplague avatars by a cult of spellscarred zealots, the Order of Blue Fire, these plague-maddened sharns are on a mad quest. Despite the plague's nature, the sharns view its chaotic tendrils as the last remaining strands of the true Weave, which is something they are desperate to preserve. As such, the sharn seek to nurture and spread active pockets of Spellplague.

To achieve this end, the sharns guide the Order of Blue Fire—a strained relationship at best. The simple truth of the matter is that the sharns don't play well with others. They prefer to follow their own shifting agendas at their own chaotic pace.

SHARN ALIGNMENT

In an upcoming *Forgotten Realms Campaign Guide* update, the sharn (page 266) will receive a revision in alignment to unaligned. This alters the plaguechanged sharns to the alignment they were always intended to have. Plaguechanged sharns are enigmatic and erratic, and they seek to spread the Spellplague, but they are no more evil than the Spellplague itself.

One might wonder why the sharn was ever published as chaotic evil. The answer to that weirdness lies in the early design for Fourth Edition, when we had a Chaotic alignment that meant "chaotic but not evil." I gave the plaguechanged sharns that alignment, because it made sense with their behavior. When the alignment system solidified, the sharn was then inadvertently switched to chaotic evil against the original design intent. The update and this sidebar correct that mistake.

—Chris Sims

HABITAT

Sharn pools are typically underground in the Sharnlands and other regions of active Spellplague. A few of their kind, the eldest of the sharns alive today, remain as guardians living under the protective mythal of the Hidden City of Hope.

Rhymanthiin: The Hidden City of Hope stands as a testament to the fulfillment of Oacanth's Vow and Dragmar's Promise—a land where all goodly races of Faerûn can live and work together with common cause and unity. Nearly the size of Waterdeep, the streets and outer walls of Rhymanthiin are orderly, with clean lines and heavy block constructions. The great boulevards and defensive walls of the city have the black-as-pitch hue of the sharns, from which any of the three-mawed defenders can emerge. Rhymanthiin remains firmly anchored to the Feywild and invisible to most outsiders. Those who have not been welcomed into the city observe only miles of untamed wilderness where the city should stand.

Perhaps surprising to some, Rhymanthiin hosts the largest number of redeemed dark elves in all Faerûn, joining with their fey fellows to relearn the ancient traditions of their people. Sharns of Rhymanthiin stand apart from their kin in wider Faerûn. Untouched by the ravages of the Spellplague, they are one with the city, their bodies composing the streets and walls of the Hidden City of Hope.

The Sharnlands: In the Underdark, about 16 miles below the Gray Vale spreading southeast under the High Moor, lie the bizarre deeps known as the Sharnlands. These sprawling caverns, home to a great number of magical ley lines and earth nodes, run for miles through the deepest part of the Northdark.

Undermountain: In the depths of the Sargauth, below Halaster's Halls, lives a mysterious creature known as the Drowned Queen, an abolethlike being thought to have unusual magical abilities akin to those of the sharns. It is whispered that the Drowned Queen was responsible for the death of a Manshoon

clone who sought to rule the Underhalls in the years following the Mad Mage's demise.

Plaguewrought Land: From the independent city of Ormpetarr, the Order of Blue Fire organizes Scar Pilgrimages into the Plaguewrought Land. Here, where the Spellplague is most active in all Faerûn, dozens of sharns dwell.

Halruaa: Much of the lore of Halruaa lives on within the few souls assimilated by the sharns before, during, and after that nation's destruction. Sharns are actively exploring the ruined capital of Halarahh in search of the *Zalathorm's Clockwork Sceptre*.

SHARN VARIANTS

"Ye hearken, the three-souled-one shall lead them and the blasted heath shall impart wonders"

SHARN BLACKCLAW POWERS

Sharn blackclaws are statistically identical to the sharn presented in the *FORGOTTEN REALMS Campaign Guide* (page 266), but they can command one or more alternative powers. You can choose any of the following replacement powers for the sharn presented in the *FORGOTTEN REALMS Campaign Guide*.

PLAGUEFIRE MAW

Substitute this power for the *leaping plaguefire* power.

† **Plaguefire Maw** (standard; recharge ☼ ☼) ♦ **Fire**

Reach 2; three attacks, each against a different target within reach; +18 vs. AC; 1d8 + 3 damage and ongoing 5 fire damage (save ends). *First Failed Saving Throw:* Ongoing 5 fire damage and the target takes a -2 penalty to Will (save ends both). *Second Failed Saving Throw:* Ongoing 5 fire damage and the target takes a -2 penalty to Will (save ends both) and target contracts level 11 Halruaan Consumption (see *FRCG* page 136).

SPELLFIRE AEGIS

Substitute this power for the *second wind* power.

◀ **Column of Spellfire** (free, when first bloodied; encounter) ♦

Fire, Force

Close burst 2; +17 vs. Reflex; 3d10 + 5 fire and force damage. The sharn gains a +2 bonus to all defenses until the start of its next turn. The sharn transforms into a 30-foot-high column of fire.

BOLT BARRAGE

Substitute this power for the *independent action* power.

Bolt Barrage ♦ **Force** (see text)

The sharn makes two ranged basic attacks against the same target. If both attacks hit, the target and all enemies adjacent to the target are knocked prone.

HEX STEP

Substitute this power for the *threatening reach* power.

Hex Step (move; when adjacent to a *hex portal*; at-will) ♦

Teleportation

The sharn teleports to any unoccupied square adjacent to a *hex portal* it created.

PSYCHIC DISPLACEMENT

Substitute this power for the *threatening reach* power.

Psychic Displacement (immediate interrupt, when the sharn is targeted by a melee or ranged attack; recharge @6) ♦

Teleportation

The sharn teleports 5 squares.

SWARMING HEX PORTALS

Substitute this power for the *threatening reach* power.

Swarming Hex Portals

The sharn gains a +2 bonus to attack rolls against targets that are adjacent to at least 2 *hex portals*.

SHARN SYMBIOTE

Sharn symbiotes are horrifying serpents of black ooze that spend their days within the gooey confines of inky, black pools unless provoked. Symbiotes are the only method of procreation for a sharn colony, though the sharns are usually meticulous when selecting those deemed worthy to merge with their collective consciousness.

GRAFT: SHARN SYMBIOTE

A sharn symbiote envelops the host from head to foot in an oily-black second skin, which shifts and writhes when agitated. A graft is a template that introduces new mechanics onto an existing creature. They function like templates, but do not alter the creature's level, nor do they make it elite, but they do make the creature slightly more complicated and a little more powerful.

Prerequisite: 10th level

Sharn Symbiote

Graft

Senses darkvision

Languages telepathy 15

Immune petrification, polymorph

↩ **Psychic Slam** (standard; at-will) ♦ **Psychic**

Close blast 5; level + 2 vs. Will; the target is immobilized until the end of the creature's next turn.

SHARN SYMBIOTE TACTICS

Sharn symbiotes immobilize prey that stray too close with *psychic slam*. If other sharns are not nearby to deal with the intruder, the symbiote uses *seize host* to compel the enemy to withdraw from sharn lands. Only as a last resort does a symbiote assimilate its host, which risks introducing unfavorable qualities into the collective.

Sharn Symbiote	Level 15 Lurker
Large aberrant magical beast (blind, ooze)	XP 1,200
Initiative +17	Senses Perception +6; blindsight 10, tremorsense 10
HP 119; Bloodied 59	
AC 29; Fortitude 27, Reflex 27, Will 28	
Immune gaze, petrification, polymorph	
Speed 6	
⬇ Slam (standard; at-will)	
+20 vs. AC; 2d10 + 4 damage.	
⬇ Seize Host (standard; at-will) ♦ Psychic	
+18 (+20 against immobilized creatures) vs. Reflex; ongoing 10 psychic damage (save ends) and the target is grabbed.	
⬇ Assimilate (standard; at-will)	
Targets a creature the sharn symbiote has grabbed; +18 vs. Will; the target is dominated (save ends).	
⬇ Psychic Feast (standard; at-will) ♦ Psychic	
Targets the creature the sharn symbiote has grabbed; +18 vs. Will; 3d8 + 9 psychic damage, and the sharn symbiote regains 10 hit points.	
⬅ Psychic Slam (standard; at-will)	
Close blast 5; +18 vs. Will; the target is immobilized until the end of the sharn symbiote's next turn.	
Host Before Symbiote (immediate interrupt, when targeted by a melee or ranged attack; at-will)	
Requires a grabbed creature; the attack that triggered this interrupt targets a creature the sharn symbiote has grabbed instead.	
Symbiotic Link	
If a creature the sharn symbiote has grabbed is reduced to 0 hit points by either the <i>psychic feast</i> power or the ongoing damage from <i>seize host</i> , the creature gains the sharn symbiote graft, regains 10 hit points, and is dominated by the sharn symbiote (a condition that can be ended only by the Remove Affliction ritual).	
Alignment Unaligned	Languages –
Skills Arcana +17, Insight +11, Religion +17	
Str 21 (+12)	Dex 23 (+13) Wis 8 (+6)
Con 23 (+13)	Int 21 (+12) Cha 24 (+14)

SYMBIOTE

Symbiotes invade or join with a host creature's body, granting the host certain benefits in exchange for great protection. In some cases, however, the symbiote is little better than a parasite leaching off a host body until the symbiote can locate another.

When a *symbiotic link* is established, the symbiote joins with the base creature. In game terms, a *symbiotic link* is a graft, which is a minitemplate that you add to an NPC or monster (*Open Grave* page 216). Not only does a symbiote introduce an interesting story and visual element to an NPC, but it also grants the NPC an extra attack.

SHARN PHASEBLADE

Sharn phaseblades are lurking horrors that deliver precision strikes with their signature black blades; each blade trails wisps of shadow in its deadly wake.

SHARN PHASEBLADE TACTICS

A sharn phaseblade uses *phase distortion* to keep away from its enemies and boost its next round's worth of attacks while delivering melee attacks through strategically positioned *hex portals*.

Sharn Phaseblade	Level 16 Solo Lurker
Large aberrant magical beast	XP 7,000
Initiative +18 Senses Perception +12; darkvision	
HP 586; Bloodied 293	
Regeneration 10	
AC 30; Fortitude 28, Reflex 28, Will 29	
Immune petrification, polymorph	
Saving Throws +5 (+8 against fear effects, and against conditions that hinder movement); see also <i>independent consciousness</i>	
Speed 4, fly 8 (hover); see also <i>phase distortion</i>	
Action Points 2	
⬇ Bite (standard; at-will)	
Reach 2; +19 vs. AC; 2d8 + 5 damage.	
⬇ Phaseblade (standard; at-will) ♦ Psychic, Weapon	
Reach 2; +19 vs. AC; 2d6 + 5 psychic damage, and ongoing 5 psychic damage (save ends).	
✈ Hex Portal (minor; sustain minor [see text]; at-will) ♦	
Conjuration	
Ranged 5; the sharn creates a hexagonal window of light that it can attack through as if it were in that portal's space. As a minor action, it can move one portal 4 squares. Portals don't block line of sight, line of effect, or enemy movement. A sharn can maintain up to three such portals at a time with a single minor action; it can close as many as it wishes with a free action.	
Independent Action (standard; at-will)	
The sharn makes two melee basic attacks. If a phaseblade and a bite hit the same target, that target is also dazed (save ends).	
Phase Distortion (standard; at-will) ♦ Teleportation	
The sharn Phaseblade teleports 10 squares and gains insubstantial and phasing until the start of its next turn. Additionally, on its next turn the sharn Phaseblade gains a +3 bonus to attack rolls.	
Double Actions	
A sharn rolls initiative twice, gets two turns during a round, and has a full set of actions (standard, move, minor) on each turn. Each set of actions corresponds to a different consciousness. The sharn's ability to take immediate actions refreshes on each of its turns.	
Independent Consciousness	
A sharn automatically saves against the dazed and stunned conditions, and against charm effects that a save can end.	
Alignment Unaligned Languages Common, Deep Speech	
Skills Arcana +18, Insight +12, Religion +18	
Str 21 (+13) Dex 23 (+14) Wis 8 (+7)	
Con 23 (+14) Int 21 (+13) Cha 24 (+15)	
Equipment 3 kukris	

Sharn Hexshadow	Level 19 Solo Skirmisher
Large aberrant magical beast	XP 12,000
Initiative +17 Senses Perception +13; special senses	
HP 682; Bloodied 341	
Regeneration 10	
AC 35; Fortitude 31, Reflex 31, Will 34	
Immune petrification, polymorph	
Saving Throws +5 (+8 against fear effects, and against conditions that hinder movement)	
Speed 4, fly 8 (hover)	
Action Points 2	
⬇ Bite (minor 1/turn; at-will)	
+24 vs. AC; 2d4 + 6 damage.	
⬇ Claw (standard; at-will)	
+24 vs. AC; 3d6 + 6 damage, and the sharn shifts 2 squares after the attack.	
✈ Lightning Ball (standard; at-will) ♦ Lightning	
Ranged 5; two attacks, each against different targets; +22 vs. Reflex; 2d10 + 6 lightning damage.	
✈ Hex Portal (minor; sustain minor [see text]; at-will) ♦	
Conjuration	
Ranged 5; the sharn creates a hexagonal window of light that it can attack through as if it were in that portal's space. As a minor action, it can move one portal 4 squares. Portals don't block line of sight, line of effect, or enemy movement. A sharn can sustain up to three such portals at a time with a single minor action; it can close as many as it wishes with a free action.	
Hex Step (move; when adjacent to a <i>hex portal</i> ; at-will) ♦	
Teleportation	

SHARN HEXSHADOW

Sharn hexshadows are masterful tacticians that can divide their forms to confuse prey and better position themselves for delivering deadly killing strikes enhanced by orbs of eldritch might.

SHARN HEXSHADOW TACTICS

Sharn hexshadows employ *shadow hex* to confuse while unleashing crackling *lightning balls* and *independent actions* against their enemies.

The sharn teleports to any unoccupied square adjacent to a *hex portal* it created.

Independent Action (standard; at-will)

The sharn makes two melee basic attacks. If a bite and claw hit the same target, that target is also dazed (save ends).

Shadow Hex (minor; not usable when bloodied; encounter) ♦ Conjuration, Illusion

The sharn creates a shadowy illusion of itself, which occupies a space exactly as though it were the sharn hexshadow. The sharn and its illusion are considered to both be the same creature, sharing the same hit point pool and the same abilities, and each one takes one of the sharn's turns each round. When a sharn is bloodied, its illusion vanishes immediately.

Double Actions

A sharn rolls initiative twice, gets two turns during a round, and has a full set of actions (standard, move, minor) on each turn. Each set of actions corresponds to a different consciousness. The sharn's ability to take immediate actions refreshes on each of its turns.

Independent Consciousness

A sharn automatically saves against the dazed and stunned conditions, and against charm effects that a save can end.

THE ECOLOGY OF THE SHEET PHANTOM

The fever sent chills down Lord Scaumble's spine. He shivered under his thin blanket, teeth chattering as if it were already winter in the drafty old house. He considered lighting the fire but thought better of it: *Fuel costs money!*

"I'll tough it out. They'll see!" he muttered to himself. "Lousy healer, trying to charge me three pieces of gold for medicine! *Three!* Well, I'll do just fine without his overpriced potions. Besides, there's no telling what was in that bottle. Colored water, more than likely. The charlatan!"

Then another thought hit his fever-wracked brain. *What if it was poison?* The thought made sense to the ailing old man, for he knew that everyone was out to get his money. *Well, they'll have to do better than that,* he told himself. *Nobody's getting me that easily, and they won't get my money when I go. It's too well hidden, with far too many safeguards.*

The thought of his numerous traps put a wicked smile on Lord Scaumble's sallow countenance. With the clammy sweat of sickness dripping down his face, he closed his eyes and lay back on his tattered pillow. Muttering to himself, he dropped off to sleep, dreaming sweet dreams of his hidden darts, contact poisons, and falling block traps.

He never awoke.

Drake pointed at the silhouette of the abandoned house on the hill before them in the light of the full moon.

"There it is: Scaumble manor." Jillian pressed close against him. Drake wrapped a protective arm around her, pleased at her reaction. He enjoyed the role of the brave, strong man.

"Nothing to be afraid of," he said. "I'm here with you. And nobody's seen crazy old Scaumble for months. The whole place is probably deserted."

"Do we have to go in?" Jillian asked.

"No, we don't *have* to. But we're going to, and I'll tell you why: They say Lord Scaumble's worth a small fortune.

Nobody saw him leave town, so I figure he either snuck off somewhere for awhile or else he's dead. Anyway, I've got it from a reliable source that he keeps his money hidden in his house."

"Says who?"

"Let's just say a reliable source," repeated Drake, winking at Jillian. He had recently been invited into the local Thieves Guild and enjoyed dropping hints about his newfound prestige without naming names. Which was a good thing, since even members of the Upper Hand had been killed for blabbing.

"It's pretty run down," commented Jillian. "It doesn't look like the old man had any money at all, or he'd have been able to fix the place up."

"That's the whole point," argued Drake. "You don't want to advertise the fact that you've got money. Now come on. I want to give the place a once-over."

"Couldn't we come back in the daytime?"

"We could be seen in the daytime. Better to work in the dark. I brought a

1. Sheet phantoms are created when a thoroughly evil person dies in bed. The death need not be natural, as with Lord Scaumble's sickness; being slain in bed can do the trick as well. What matters most is that the person is evil and desperately does not wish to die, usually because there are matters to which he wishes to attend. Thoughts of vengeance often trigger the transformation into a sheet phantom, especially among those slain in bed.

Some sages have speculated that the sheet phantom might be an undead form of a lurker above (a D&D monster from

previous editions of the game). This is nonsense: Not only is the lurker above much larger than a sheet phantom, but it is found almost exclusively in subterranean environments. Sheet phantoms, on the other hand, begin their "unlife" inside a dwelling, usually a bedroom.

2. Sheet phantoms move telekinetically at a Speed of 20 feet (average maneuverability). When newly formed, they tend to move about as they did in life—that is, hovering above the floor at the same height as if they were still alive. As they learn more about their new forms, they

gain the abilities of levitation and flight. Sheet phantoms can hover motionlessly in one spot if necessary. They often flatten themselves against a wall or ceiling and drop down upon their prey.

3. Those who become sheet phantoms after being killed in their sleep often sport impressive bloodstains on the fabric of their new "bodies."

4. Although embodied in the linen of a simple bed sheet, sheet phantoms can form invisible, ectoplasmic bodies that mirror the bodies they had in life. When such a humanoid body is formed, the sheet is

lantern for once we're inside. Now come on, we're wasting time."

Jillian shrugged and followed Drake up the path to the decrepit manse.

Lord Scaumble was amazed to find himself looking down at his own face. It was a face he was used to seeing every morning in his cracked mirror as he dragged his old razor across his chin. But this time it was different.

For one thing, his wart was on the wrong side. Scaumble had a wart half the size of a copper piece on the left side of his nose, and he scowled at it in the mirror every morning. Of course, in the mirror it looked like it was on his right side, but here it was on his left.

Even more disconcerting, his eyes were closed. That in itself was rather odd: How could you look at your own closed eyes? Then he realized with a start that his face was unnaturally still. He wasn't breathing!

It was at that moment Lord Scaumble realized he was dead.⁴

He sat up just then, knocking the thin blanket to the floor in the process. Looking down upon his frail form—his frail, dead form—he wondered just what he had become. A ghost?

draped as if over a human body,⁴ standing in the reflection of Lord Scaumble's cracked shaving mirror.

How could this be? he thought. *How did I become trapped in my own bed linen?*⁵ It made no sense. He stared at his reflection. *Come to think of it, how is it that I can see at all?*⁶

Puzzled, the sheet phantom floated back and forth across the bedroom, pacing, trying to put things together.

The doors were all locked. Drake expected that; in fact, he had even counted on it, for it gave him a chance to show off in front of Jillian. "Watch this," he said, spreading his tool kit on the back porch and selecting a lockpick by the light of the moon. Expertly sliding it into the lock, he wiggled it around, and ... nothing. "Wait a minute," he said. "Okay, I flick it just right, and ... this time for sure ... almost got it ... shoot." Jillian looked down at him, lips pursed, less than impressed.

"Let me try this one," Drake said, choosing another lockpick. "A quick twist, a little jiggle, and ... shoot. Okay, here we go ... no, wait a minute ... almost got it ... there!" He felt the lock give, pulled out his pick, and turned to

put away his kit. Then, without a further word, he brushed past her and went inside. Jillian closed the door behind him. It shut with an eerie squeak, then all was silent.

Scaumble patrolled his house every night. He had become quite the creature of the night since his death; during the day, he became sluggish,⁷ often spending hours upstairs in his bedroom simply watching his former body decay, a process he found quite fascinating. Flies had discovered his corpse soon after his death, and now it was riddled with squirming, white maggots. Lord Scaumble could only imagine the stench and was grateful that his sense of smell had not survived the trip into undeath.

The flies and maggots he suffered to live upstairs in his bedroom; after all, there was little they could do to his traps or his well-hidden money. He had found evidence of rats in the basement, though, and hunted them down whenever he could. He was worried about the rats; some of them were quite large and could conceivably set off one of his traps if they made their way upstairs, so he was ever on the lookout. Whenever a rat came into view, Lord Scaumble dropped his linen body onto the creature and wrapped it tightly within his folds, smothering it.⁸ The death of each creature brought great pleasure to the sheet phantom, and in time he sought out the rodents for the delight of the kill as much as for the safety of his traps.

FLIES HAD DISCOVERED HIS CORPSE SOON AFTER HIS DEATH, AND NOW IT WAS RIDDLED WITH SQUIRMING, WHITE MAGGOTS.

He stood up—it felt as if he stood up⁴—and went to the mirror. He was shocked by what he saw.

Lord Scaumble was now, to all appearances, embodied in the stained, graying sheet from his bed.⁴ He turned back to look at the bed. There was the blanket on the floor. There was his human body—no sheet. He turned back to the mirror. There was the sheet,

Jillian for his well-deserved praise.

She wasn't there.

"Jillian?" called Drake quietly.

The door opened with a creak. Drake gasped in fright and jumped back a step before realizing it was Jillian herself in the doorway. "There was a broken window around the corner," she said. "Did I scare you?"

Drake bit back his anger and quietly

The lantern did little to illuminate the room. Everywhere there were shadows, as if the house knew of its master's death and refused to submit to the intrusion of light. Still, all Drake wanted was a quick look around. He seriously doubted he'd find Lord Scaumble's hidden treasure trove right away; this was more of a familiarization tour, as well

draped over it like a child in a Halloween costume. Forming such a body becomes second nature for the sheet phantom, and it can form or dissipate the body with a thought. The ectoplasmic body allows the sheet phantom to grasp small items (those weighing less than 5 pounds). Fine manipulation is not possible, for the invisible "hands" are covered with the fabric of the sheet. Thus, while a sheet phantom could pick up a candle, it couldn't light it with flint and steel or a tindertwig. It could push a book onto the floor but

couldn't easily flip the pages.

The ectoplasmic "body" of a sheet phantom is not visible even to those able to see invisible or ethereal creatures. It is closer to a field of energy than a physical object.

5. Many sages speculate that the bed linen acts as a resonator of psychic emanations, that during the hours spent in slumber the sheet becomes "imprinted" with the individual's life essence. This could be especially true if the person dies violently, as psychic phenomena have been traced to sudden violence.

6. A sheet phantom sees and hears as well as it did in life. It also has a limited sense of touch but is unable to taste or smell.

The sheet phantom has no facial features, with the exception of two glowing green spots that serve as its eyes. These "eyes" appear only when the creature attacks, possibly to add to the terror of the victim. In any case, the sheet phantom's eyes can appear anywhere on its body. When floating with an ectoplasmic "body," the sheet conforms to the body's shape, and the eyes appear where one might

as a chance to impress Jillian. Unfortunately, his fumbling at the door had left her less than thrilled at his prowess. He'd have to find another way to get her to notice him.

Drake thought his chance had come when they heard the chittering and scratching of a rat—a rather large one, by the sound of it. Jillian pressed close to the young thief, throwing fearful glances all around her. Here's my chance, thought Drake, as he spotted the rat skittering across the floor.

Quick as a wink, Drake drew a dagger from his boot and let it fly. His throw was perfect, skewering the creature before it even knew what hit it. He put his hands on his hips and struck a confident pose, looking back at Jillian and expecting a look of deep admiration.

All he got was a look of disgust. "Ewww!" she cried. "Get it out of here!"

Disheartened, Drake recovered his dagger, wiped the blade on the rat's fur, and returned it to his boot. He kicked the dead rat out of sight.

"Do you think there are any more around here?" asked Jillian, swinging the lantern around worriedly.

"Probably," replied Drake. "Don't you worry, though. I'll keep you safe."

"Do you have any other knives?"

"Um, yeah ..."

"Let me have one, then. I'll feel safer—and not the one with blood on it. Yech!"

Drake pulled the small blade he kept sheathed at the back of his belt and passed it to Jillian, frowning at her lack of reassurance at his skill. This wasn't quite working like he had planned. He tried to focus on finding Lord Scaumble's loot. At least the night might not be a total loss!

"Let's try in here," he said, heading toward the kitchen.

Scaumble heard the voices downstairs and glided silently along the stairway.

So, looters have come at last, he thought.

There were two of them, a man and a woman, both young. Lord Scaumble liked those odds. For a moment he considered allowing them to waste their time downstairs—all of the traps were upstairs, closer to the hidden loot in the attic—but the thought of two strangers going through his things infuriated the sheet phantom. He might have no use for kitchen cutlery in his undead form, but it was still his! Plus, if he allowed them upstairs so they could fall prey to one of his devious traps, he'd end up wasting at least one of them. Lord Scaumble realized that in his current form he'd be unable to reset the traps once sprung, so it was best to leave them as a last line of defense, to be used only if absolutely necessary.

With an urgency born of determination and hatred, the sheet phantom glided through the hallway and into the kitchen.

Pulling cobwebs from her hair, Jillian shrieked, "Ick! Spiders!" She had been checking out the walk-in pantry, hoping to discover a secret compartment.

Drake just shook his head and returned his attention to poking at the floorboards with his dagger, trying to find a loose one where Lord Scaumble might have stashed his loot. As a result, he didn't see the sheet phantom gliding up silently behind him.

Jillian did. "Drake!" she screamed, as the floating bedsheet spread out wide before dropping down on the unsuspecting thief. As it fell, Jillian caught a glimpse of hate-filled, green eyes glowing in the center of the sheet.

Despite Jillian's scream, Drake had no time to react before finding himself bound in a constricting mass of linens. He still had the dagger in his hand, but his arms were pinned at his sides.⁷ He thrashed back and forth, kicking with his feet, but he couldn't escape.

Suddenly, a line of pain traveled down his right thigh as Jillian slashed at the creature with the small blade Drake had given her.⁸ She cut a jagged slit in the animated sheet, enough to free Drake's right arm and allow him to wriggle free.

Drake managed to slip his head out from under the sheet and gasped for breath. He saw Jillian tugging at a corner of the sheet with all of her might, a look of fierce determination on her face. "Almost got it!" she cried with teeth clenched. Then, with a ripping sound, the creature was off of him, and Drake was free.

In the feeble glow of the lantern's light, Drake saw the sheet bob like a wild kite, Jillian still holding on to one corner. With an eerie grace, the thing spun around in midair, tattered edge flapping where Jillian's blade had cut Drake free,⁹ and almost casually flipped over onto the young woman.

Time seemed to freeze for Drake. Propped on hands and knees in Lord Scaumble's kitchen, he was immediately aware of several things at once. Jillian had dropped her knife to tug the creature off of him; there it was on the floor at the edge of the lantern-light, stained with his own blood. The creature had wrapped itself completely around Jillian and was squeezing her tightly. Vaguely, he could hear her gasping and whimpering, as if from far away. Finally, his leg was still bleeding from where Jillian had gashed it cutting the monster off of him. It throbbed with a dull ache.

All of this took but a split second, and then Drake, with the quickness of his thief's training, had assessed the situation and come up with a plan of action. Limping, he got to his feet and hightailed it out the door, leaving behind his daggers, his lantern, Lord Scaumble's hidden fortune, and Jillian.

expect. When flattened against a wall or ceiling, the eyes are usually located at the center of the sheet, but this isn't always the case; the sheet phantom can cause its eyes to appear at a corner if it so desires. Furthermore, it can "throw" its eyes on either side of the sheet. When smothering a victim, the sheet phantom often focuses its eyes directly over those of its prey, watching the life snuff out of the victim's body as she suffocates, but the sheet phantom can project its vision outward if it hears the approach of another creature.

7. Sheet phantoms are most active at night.

Exposure to sunlight slows them to half movement, and a sudden bright light (the casting of a *light* or *daylight* spell, for instance) causes them to recoil for 1d3 rounds.

8. A sheet phantom must make a normal attack roll when it drops onto a victim; success indicates it deals normal damage and attempts to start a grapple as a free action without provoking an attack of opportunity. (See Grapple on page 137 of the *PH*.) If the phantom wins the grapple

check, it has wrapped its prey in the folds of its body and suffocation begins. The following round, the victim must hold her breath or begin to suffocate. (See the Appendix at the end of this article or page 88 in Chapter 3 of the *DMG*.)

9. The victim of a sheet phantom's suffocation attack can attempt to escape once each round. The victim and the sheet phantom make opposed grapple checks; success on the victim's part indicates freedom. (The victim has the option of using an Escape Artist skill check against the sheet

**The terrifying sheet phantom has several weaknesses.
Holy water, fire-based attacks, and natural sunlight all have adverse effects on the creature.**

Scaumble stared into the woman's terrified eyes and saw the moment when life passed from her body.

This time, he kept his linen form wrapped tightly around his victim. If the looters had already begun to snoop around his place, he'd have to be ready for them. As it was, there had been just two of them this first time, armed only with daggers, and look at what had happened: He had been injured and one of them had escaped. He'd have to do better than that if he was to keep his precious hoard intact!

He had slain the woman shortly before midnight. He stayed wrapped around her dead flesh all that night, and well into the next morning. The sun was near its zenith when the transformation was complete, and Lord Scaumble stood up on two solid legs once again.¹⁰

It was good to feel solid flesh again! Lord Scaumble turned from the kitchen and staggered down the hall, eager to climb up to his bedroom and get a good look at himself in his shaving mirror.

On his way, he passed the dead rat that Drake had killed the night before. A

strange sensation passed over him, one he had all but forgotten during his time as a sheet phantom. He grabbed the rat with twisted fingers whose nails had grown overnight into claws and bit into the animal's dead flesh with teeth that had likewise become sharp and pointed.¹¹ Hunkering down into a squatting position, he ripped apart the rat with relish, devouring it all, down to the bones. After he was finished, he slid his long, blackened tongue over his lips and grunted in satisfaction.¹² It had been—what?—months since he'd eaten, and

phantom's grappling roll. See Grapple on page 137 of the *PH*.) The victim cannot attack the sheet phantom unless he or she holds a Tiny weapon, like a dagger or knife, when first enveloped. Animals are allowed their normal claw and bite attacks.

10. If a sheet phantom is attacked while enveloping prey, the victim suffers the same damage inflicted on the sheet phantom. After all, the creature is comprised of only a single sheet of linen, which does little to protect the victim within. On the other hand, while sheet phantoms are

immune to bludgeoning attacks, the victim has no such protection, and any attacks with a blunt instrument on a sheet phantom that has successfully grappled someone inflicts full damage to the victim.

11. Damage done to a sheet phantom heals over time, at the rate of 3 hit points per day. Of course, any physical damage to the sheet phantom's linen "body" is permanent (once cut or ripped, the sheet remains so), but this does not hamper the creature. Sheet phantoms do not feel pain.

12. The transformation from sheet phantom to sheet ghoul takes about 12 hours, during which time the life essence trapped in the sheet is transferred into the slain victim. As part of the transformation process, the fibers of the sheet break down and merge into the body, so the sheet ghoul often looks like it's covered in cobwebs. The change is completely optional on the part of the sheet phantom; it can release itself from its slain prey and remain a sheet phantom for as long as it desires or merge with its victim and become a sheet ghoul.

now the rat served only to remind him of his sudden, ravenous hunger. He'd have to find some more food before long, maybe the rats he'd killed in the basement earlier as a sheet phantom.

Making his way up the stairs, Lord Scaumble felt suddenly dazed and drugged, his thoughts becoming sluggish and confused. What was he doing? Going upstairs. Why? Because ... because. Where was Drake? Why had he left her to die?¹⁵

Staggering into the bedroom on instinct alone, Lord Scaumble froze at the sight that awaited him. It was a body—his body—no, she'd never seen it before—lying in a decomposing mess on the bed. The stench of corruption hit him—her—like a wall, and she had never smelled anything so tantalizing before. Licking her lips with a raspy tongue, she crossed the room to her maggot-ridden feast, all thoughts of Lord Scaumble's cracked shaving mirror temporarily forgotten.

Drake stood at the path that led to the old Scaumble estate, gathering his courage. He still didn't know what kind of ghost had attacked him, but he knew he'd have to go back in there and face it. He had come prepared: It was full daylight, so maybe the ghost wouldn't be around, but just in case he had a vial of holy water with him. He had also borrowed a magic short sword from one of his new pals at the Upper Hand. Perhaps "borrowed" wasn't the best word, but he'd get it back before it was missed. He was unsure what would be effective against the undead creature, and he prayed he had chosen his weapons wisely.¹⁶ There wasn't anything else he could think to do, so he took a deep breath and headed down the path toward the Scaumble estate. After all, he had unfinished business at the manor.

If anyone found Jillian's body there, with his dagger and lantern at the

scene, he could be implicated in her death.

Drake favored his right leg as he walked up to the porch. Taking a moment to listen at the door and hearing only silence within, he pushed open the door with a creak. Heart pounding at the sound, Drake remained motionless and waited. After two full minutes had passed without incident, he figured he was safe; the ghost would have investigated the sound by now if he had been heard. Drake tightened his grip on his magical sword and went inside.

It was dark in the house, despite the sunshine outside. Most of the windows had their shutters closed, and those without had moldy black drapes pulled shut. *Lord Scaumble certainly liked his privacy*, Drake thought. *Good thing, too. I don't want anybody seeing what I'm about to do.*

Drake turned left and headed for the kitchen, all thoughts of exploring the place for the hidden loot superseded by the need to hide Jillian's body. He walked quickly down the dark hall, eager to get the unpleasant task over with, failing to notice in his haste that the rat he had killed the night before was no longer there.

He was shocked when he entered the kitchen, for Jillian was missing. Puzzled, he scanned the floor, thinking she might have crawled away before the ghost finished her. Worse yet, what if she escaped? Escaped, and lived to tell how he had abandoned her? That wasn't going to be good for his reputation!

"Looking for me?" a raspy voice asked from behind him.

All of the hairs on the back of Drake's neck stood up. He knew what he would find if he turned around.

He turned around anyway.

Jillian stood before him, lips twisted in a hideous rictus of a smile. Her skin was a pallid yellow-white; ragged claws extended from her fingers. Loose fibers

clung to her disheveled hair, reminding Drake of the spiderwebs that had so upset her the night before. And her eyes! Her eyes glowed the same evil shade of green as the two spots of light that the young thief had seen shining on the sheet-ghost, right before it swooped down on his friend.

The two stood at opposite ends of the kitchen, the sole doorway immediately behind Jillian. Drake knew he'd have to get past his undead companion if he wanted to escape the room alive. The sparkle in Jillian's green eyes told him that she knew it, too.

Drake tightened the grip on his weapon, preparing to strike. He never got the chance. Jillian opened her liver-colored lips and vomited forth a stream of acid.¹⁷ Drake screamed in agony as the fluid struck his face, burning the vision from his eyes. He dropped his stolen sword and the vial of holy water, clutching at his wounded face. Blinded, Drake was thrown to the floor with ease. He felt Jillian straddle his body, rip his hands away from his face with a savage grasp, and plunge her razor-sharp teeth into the soft flesh of his neck.

As his life's blood spurted onto Lord Scaumble's kitchen floor and his body was ripped to shreds by the undead body of the friend he had betrayed, Drake's final, insane thought was: *Now I'll never get to find the hidden loot!* Then his consciousness left him forever.

Lord Scaumble, firmly entrenched in the ghoul-body of the female looter, smiled down at his handiwork. Oh, it had taken a while to get used to the idea of being in a woman's body, but he had gotten over the initial shock. He had two arms and two legs, sharp teeth and claws; what else could he ask for? Besides, female or no, the body worked just fine when it came down to what mattered: the rending of flesh, the crushing of bones, and the sucking of sweet, sweet marrow.

Most sheet phantoms eventually long to possess a physical form once again, though, and so take advantage of the opportunity when they can.

This aspect of the sheet phantom makes it unique among undead creatures, as the sheet phantom can be thought of as the "larval stage" of the sheet ghoul. Few undead beings have such a cycle in their development.

13. A sheet ghoul attacks twice each round with its jagged claws; each claw attack deals 1d3 points of damage. In addition, the creature bites for 1d6 points of damage.

Unlike normal ghouls, a sheet ghoul does not cause paralysis with its touch.

14. Though undead, sheet ghouls have an appetite for both freshly killed prey and carrion. As with true ghouls, the flesh they eat maintains their undead bodies, and they have a limited time as undead before their bodies decompose. Sheet ghouls can expect to "live" for about 200 years.

15. Shortly after transformation into a sheet ghoul, the creature becomes bewildered as its undead mind tries to make sense of two sets of conflicting memories: those of the evil individual who became the sheet phan-

tom and those of the victim whose body became the template for the ghoul. Of the two, the victim's memories tend to be vague and indistinct, as the sheet phantom's evil intelligence holds sway. In time, the sheet phantom's mind gains full dominance, but occasionally a stray memory from the victim makes its way to the surface of the creature's mind.

16. Holy water is a potent weapon against sheet phantoms: Because of their linen nature, they absorb liquids and thus suffer 1d4+4 points of damage per vial of holy water instead of the standard 2d4. Fire is

Sheet phantoms typically attack by dropping upon their victims and suffocating them.

He climbed the stairs up to his bedroom, deactivated the blade trap in the far wall, and opened the top drawer of his bureau. Pulling on a pair of thick leather gloves from long habit, he pulled down the cord to the trap door in the attic before realizing the contact poison on the pull-cord need concern him no longer.¹⁸

Once opened, the trap door extended to become a ladder. Throwing down his gloves, Lord Scaumble picked up the trophy he had brought upstairs with him and climbed into the attic. The

room was lit only by the feeble rays of sunlight peeking through various tiny cracks in the roof. Lord Scaumble stumbled down the length of the attic, passing his riches: hundreds of thousands of coins, mostly copper, that he had stashed away over his three score miserly years. The coins were stacked haphazardly, spilling out of old flour sacks, overflowing from wooden crates, forming small piles throughout the cramped attic.

Making his way to the back of the room, Lord Scaumble placed his trophy

gently on the top of the largest loose pile of coins and smiled appreciatively at the result. Drake's severed head looked sightlessly out at Lord Scaumble's hidden loot, eyes bulging out and bubbling from the sheet ghoul's acid attack.

"Enjoy the view," the undead creature cackled, then turned away and climbed back down to his bedroom to reset his traps and resume his vigil.¹⁹

also effective against sheet phantoms. Any fire-based attack (normal or magical) inflicts an extra point of damage per die rolled. Although the size of the sheet phantom's body varies depending upon the size of the sheet, it is considered a Medium-size creature in combat.

On the other hand, as undead, sheet phantoms are immune to mind-influencing effects, poison, *sleep*, paralysis, stunning, and disease. They are not subject to sneak attacks, critical hits, ability damage, subdual damage, energy drain, or death from massive damage.

17. One of the major modifications to the host's body during the process of transformation from sheet phantom to sheet ghoul is the development of acid-producing glands in the stomach cavity. A sheet ghoul can spit a thin stream of corrosive acid from its mouth to a range of 10 feet. The acid can strike only a single target and deals 1d8+1 points of damage (half damage with a successful Reflex saving throw). The acid is similar to the venom of many spiders, which begins breaking down organic matter so that the spider can slurp up the liquid remains.

Because of the extreme corrosiveness of the sheet ghoul's stomach acids, all ingested food is completely dissolved. Thus, although it eats prodigiously, the creature leaves no droppings.

18. Sheet ghouls enjoy the standard immunities of all undead.

19. Sheet ghouls are solitary creatures seldom found in any numbers. The only time several sheet phantoms are likely to be created simultaneously is during a plague. It is possible to imagine several sheet phantoms haunting the abandoned wing of a healing temple after such an outbreak.

APPENDIX: THE SHEET PHANTOM AND SHEET GHOUL

SHEET PHANTOM

Medium-Size Undead

Hit Dice	3d12 (20 hp)
Initiative	+3 (Dex)
Speed	20 ft., fly 20 ft. (perfect)
AC	17 (+3 Dexterity, +4 natural)
Attacks	Buffer +3 melee
Damage	Buffer 1d4+2 subdual
Special Attacks	Smother, improved grab
Special Qualities	Undead, darkvision 60 ft., immune to blunt weapons, weaknesses
Saves	Fort +0, Ref +3, Will +0
Abilities	Str 15, Dex 16, Con —, Int 10, Wis 10, Cha 15
Skills	Listen +8, Move Silently +16
Feats	Blind-Fight

A sheet phantom is the undead manifestation of an evil person who died in bed, embodied in the bedsheet that covered the corpse. It has no facial features save two glowing, green eyespots. Sheet phantoms glide effortlessly through the air by an innate form of telekinesis.

Combat

Sheet phantoms attack by dropping upon unsuspecting prey and suffocating them in the folds of their bodies.

Improved Grab (Ex): A successful attack indicates the phantom deals normal damage and attempts to start a grapple as a free action without provoking an attack of opportunity. (See Grapple on page 137 in the *PH*.) If the phantom succeeds at the grapple, it has wrapped itself around its prey. The following round, the victim must either hold her breath or begin taking suffocation damage. (A character can hold her breath for 2 rounds per point of Constitution. After this time, the character must make a Constitution check (DC 10) in order to continue to hold her breath. The check must be repeated each round, and the DC increases by +1 for each previous success.) If the victim runs out of breath, she falls unconscious (0 hp). In the following round, she drops to -1 hit points and is dying. In the third round, she suffocates. A victim can escape a sheet phantom's embrace by making an opposed grappling check or an Escape Artist roll against the sheet phantom's grappling roll. While encumbered, a victim can only use a Tiny weapon like a dagger, and then only if it was in hand when first enveloped by the sheet phantom. Damage inflicted on a sheet phantom while it encompasses a victim causes an equal amount of damage to the victim. Blunt weapons inflict full damage upon the victim but do not harm the sheet phantom.

Undead: Sheet phantoms are immune to mind-influencing effects, poison, *sleep*, paralysis, and disease. They are

not subject to critical hits, subdual damage, ability damage, energy drain, or death from massive damage.

Weaknesses: For all their deadly suffocation ability, sheet phantoms have a number of weaknesses. Holy water inflicts 1d4+4 points of damage per vial on a sheet phantom instead of the standard 2d4 points of damage. In addition, all fire-based attacks (normal or magical) inflict an extra point of damage per die. Finally, sheet phantoms recoil from natural sunlight and bright lights (like a *daylight* spell). If exposed to direct sunlight, sheet phantoms take 1d3 points of damage. They move at half speed during the day.

Spawn

A sheet phantom can merge with the body of any humanoid it slays. The process takes about 12 hours, after which time the victim and sheet phantom transform into a sheet ghoul.

A sheet ghoul is the result of a sheet phantom merging with its humanoid victim. It looks like a normal ghoul, but closer inspection might reveal wispy strands of white material clinging to its face like cobwebs or a decaying shroud. This is the remains of the sheet phantom's linen form.

Sheet ghouls devour carrion and freshly killed prey.

Combat

Sheet ghouls rend with their claws and bite with their sharp teeth.

Acid (Su): A sheet ghoul's breath weapon is a fine spray of powerful stomach acid that inflicts 1d8+1 points of damage, or half that with a successful Reflex save (DC 14). The acid stream has a range of 10 feet and can target only a single victim. A ghoul can spray acid in melee combat, but it cannot use its bite attack if it uses the acid spray. Spraying acid is a ranged attack, so using this ability in melee combat provokes attacks of opportunity.

Undead: Same as sheet phantom. 

Sheet ghouls are almost always encountered singly. They are shunned by normal ghouls and ghosts, who attempt to drive sheet ghouls away whenever they are encountered. This might simply be out of fear, but it probably also has something to do with the fact that a sheet ghoul cannot "propagate" its species the way ghouls and ghosts can. Since both ghouls and ghosts are often found running in packs, they have no use for an undead creature that is unable to expand the pack's own numbers.

Ecology of the Shoggoth

By Phillip Larwood

Art by Rhiannon Rasmussen-Silverstein

The midnight mist thinned as the creature approached... an indescribable terror that seized my already overtaxed mind and left me shuddering with equal parts abject horror and breathtaking awe.

The creature before me was no ordinary fiend of the night, no simple ogre or demon emerging from the wafting miasma to rend my flesh or steal away my soul. No, this vast and ancient protoplasm seethed and roiled as if moved by otherworldly tides — it was the end of sanity and the beginning of madness.

When I screamed, it matched my cries with a voice that was my own.

Few creatures in the world inspire more dread than the shoggoth, a monster whose appearance causes rational minds to wither. Few can describe its demented inconceivable visage or the maddening cacophony that pipes from its many orifices. Despite the legendary horror of these creatures, few know their far-flung origins or the terrible connection that they share with all other life forms on the planet.

The Beginning

In ancient prehistory, a race of planar-spanning alien creatures known simply as the elder things ruled many worlds. Their power was akin to that of the ancient titans themselves. They stole the secrets of creation from the primordial gods to seed otherwise barren worlds with the first whispers of life, a grand experiment that would have far-reaching implications. On many worlds, this experiment was ultimately doomed to failure, yet occasionally, life did indeed take hold, and entirely new species rose up out of the primordial soup of creation to take over the land, sea, and air.

While life flourished on these worlds, not all of the organic material was used up in the act of creation. The elder things cast aside the leftover dross or slag, and it quietly sank into the lightless oceanic depths or was left festering in cyclopean caverns. Soon forgotten by those on the surface, this oozing afterbirth did not die but instead found a life of its own and flourished in the stygian darkness, becoming the first proto-shoggoths and oozes.

The Masters of the Shoggoths

One of the first races to rise out of the stinking mire as a result of the grand experiment of the elder things were the aboleth, an evil ichthyoid race obsessed with enslaving other life forms. [Editor: see *Sunken Empires* for more details on the aboleth's plans and magic.] The aboleth inhabited many of the same environments as the proto-shoggoths and saw in the creatures a way of conquering the other races of the depths without endangering themselves. All they needed to do was bend the race to their demands. Given the great mental powers of the aboleth and the weak minds of the shoggoths, this task was no more difficult than drawing water over your gills—for an aboleth.

For countless millennia, the aboleth used the proto-shoggoths as their most powerful slaves, living siege engines capable of destroying anything in their path. Over that time, they continued to mold the shoggoths to their whims, transforming them into their current abominable shapes and increasing their size and power. However, this evolution also created a glimmer of intelligence in the shoggoth race, and the servitors began to resent the aboleth for their cruel and tyrannical ways.

When the drow and sahuagin arose to contest the aboleth for dominion over the oceans and underground depths, the shoggoths saw a chance to rebel against their terrible masters. The resulting slave rebellion unleashed such unmitigated destruction that the aboleth were almost wiped out; most fled into the Underdeep, the darkest ocean trenches. After it was over, the surviving shoggoths were free, so they slithered off into the darkness where they would never be controlled again.

Physiology

Few words can coherently describe a shoggoth's anatomy without falling well short of the mark, for the creature's form is so completely mutable that it changes almost by the second. While fundamentally an ooze like a black pudding or ochre jelly, a shoggoth can form mushy organs, throbbing sacks, eye-studded pseudopods, and weird toothless mouths from its central bulk, something beyond the grasp of most oozes. In addition, while most oozes have no Intelligence, shoggoths can think and even reason, allowing the creature to use simple

tactics and even long-term plans, a task likewise beyond most oozes.

The typical shoggoth is as large as a small cottage but can squeeze or expand its body into a variety of shapes depending on its needs. While a shoggoth does not have the fluidity of most other oozes, its body is plastic enough to move through spaces up to two sizes smaller without having to squeeze, and it can move through apertures up to three sizes smaller while squeezing. This allows the shoggoth to reach creatures that might otherwise think they are safe from the creature's hunger.

Like other oozes, shoggoths must constantly feed to power their immense bodies, engulfing and absorbing any organic matter they can catch. While most shoggoths have no particular preference when it comes to what they consume, some acquire specific tastes, including a taste for particular humanoid races, certain varieties of trees, or monsters such as chuuls and krakens. Like most other oozes, shoggoths produce little waste material and anything devoured by the creature is

almost completely consumed and added to the creature's bulk.

Despite the shoggoth's strange physical features, the most startling aspect of its physiology has nothing to do with its appearance but is, rather, its ability to produce a startling array of sounds. Its vocal structure seems deceptively simple yet hides much complexity because of the way it can reshape itself. The shoggoth uses the strange piping orifices dotting its body to create its maddening cacophony and to reproduce virtually any sound they have heard. Indeed, shoggoths can learn to speak any language, given enough time and patience, and many ancient shoggoth specimens have been heard to speak a passable Abyssal, Draconic, or Undercommon.

Shoggoths are asexual and reproduce by budding, creating tiny shoggoths that are ejected from the main body in a frenzy of activity and obscene, almost orgiastic piping. Adult shoggoths quickly consume most of the young, but the fleetest and luckiest offspring survive to continue the species and pass on the collective memories of their ancestors.

Psychology

Many creatures are surprised to discover that shoggoths are thinking creatures capable of both speech and the ability to learn. Despite this, one should never mistake a shoggoth's intelligence or thought patterns with anything that can be interpreted or understood by humanoids, for the shoggoth's mind is a fractured and warped creation of terrible longing and rage—a mind that is completely insane.

While not evil, shoggoths are random and unpredictable in their actions. The only thing that can be predicted to a reasonable certainty is that they will try to eat anything they encounter. They are driven not only by an endless hunger but also by an abject loneliness resulting from their forced separation from the rest of creation, so they try to fill that void as best they can—by assimilating all organic matter. The greater tragedy, perhaps, is their futile attempts at communication: their maddening cries are simply poorly conceived attempts to make whatever is consumed understand the reason for its inevitable liquefaction.

One of the strangest aspects of

shoggoth psychology is the rare lucidity that their minds enter after they consume a creature with an Intelligence score of 13 or greater. This lucidity can last anywhere from a few hours to a few days (roughly 3d20 hours), but while it persists the shoggoth can communicate fluently with any creature that can understand the secret language Aklo and make rational and reasonable decisions. During these rare moments shoggoths converse with the cultists who revere them, and they have the wherewithal to create gibbering mouthers.

When the shoggoth's lucidity passes, it returns to its more typical behavior and, once again, consumes the cultists and others near it.

Gibbering Mouthers and Shoggoths

Sages have long postulated a connection between gibbering mouthers and shoggoths, hinting at a similarity in body shape and the maddening qualities of their incoherent murmuring. While weird curses and magical accidents have been known to create gibbering mouthers, the truth is shoggoths have a much closer connection to them than sages suspect they do. Most gibbering mouthers are literally shoggoth children; they are created during moments of shoggoth lucidity. At those times, the shoggoths have enough control over their powers to transform living creatures they have engulfed into smaller versions of themselves.

The process that transforms a living humanoid into a gibbering mouter is little understood, but it involves infusing massive amounts of living humanoid tissue with the chaotic essence of the shoggoth's own misbegotten creation. This attempt at creating life can only be achieved by a lucid shoggoth (see above), and seems to be driven by the shoggoth's need to share in the joys of creation. However, the results are never what the shoggoth wants: who knows what perfection it is striving for?

The shoggoth just as quickly slays most gibbering mouthers it has created, but a few of them serve the mad cults

dedicated to the shoggoths or escape to terrorize the land. Often these gibbering mouthers possess abilities superior to those created through other means, such as increased size or power (giving the gibbering mouter the advanced or giant templates), immunities, or special attacks.

Shoggoth Cults

Very few creatures would ever willingly serve a shoggoth let alone worship one. However, several cults dedicated to these horrible oozes exist and may be found in places one would not normally expect them. Their names tend to the florid, such as the Cult of Evanescent Purity or the Mystic Order of the Primordial Star.

Most shoggoth cults spring up when a group of primitive and chaotic humanoids such as gnolls, orcs, or trolls discover a shoggoth and manage to placate the creature's incredible hunger. This usually involves feeding a shoggoth at least 300 day's rations to start (or 20 Medium-size creatures), and at least 20 day's rations (or 2 Medium-size creatures) each day thereafter. Cultists refer to this as the Great Feeding or the Great Feast.

The humanoids who know the secret of the Great Feast equate shoggoths with other powerful natural forces, such as hurricanes and volcanoes, and worship them for their destructive capabilities as living gods. Usually, the humanoids feed the shoggoth enough to keep it docile, but inevitably, the shoggoth destroys the tribe once the food runs out.

The more dangerous shoggoth cults occur when a group of degenerate humans, elves, or derro turns to the worship of a shoggoth, seeing them as living embodiments of some divine being, force, or principal.

These cults normally keep the shoggoth locked away in a great cavern or dungeon and feed it sacrifices taken from the local populace, slaves, or from other sources. Many of the cults also hunt down intelligent sacrifices (such as scholars, teachers, and wizards) to create lucid shoggoths,

thus enabling them to breed gibbering mouthers or even take some of the shoggoth's bubbling protoplasm to infect themselves with its chaotic otherworldly taint. The most successful shoggoth cults actually worship a chaotic evil entity like Marbas (from Green Ronin's *Book of Fiends*) rather than the shoggoth itself, seeing in the massive ooze some aspect of their god.

Mouths of Madness

Usually a shoggoth's protoplasm is completely indigestible, but it can be imbibed if properly prepared by a skilled spellcaster. Those who survive the consumption of *shoggoth brew* form an empathic link with the shoggoth. From then on, these "mouths of madness" can withstand the maddening cacophony of the shoggoth and gibbering of any created mouthers and can communicate with the shoggoth without risk of being consumed.

This ability does not come without a price. Most mouths gain one or more physical or mental characteristics that mark them as aberrant creatures. These marks can include an extra lidless eye growing on a palm, an irrational fear of open spaces, bouts of homicidal rage, a small tentacle growing from an ear, or the like.

Shoggoth Brew

Aura faint transmutation; **CL** 7th
Slot —; **Price** 750 gp; **Weight** —

Description

Anyone drinking this foul-smelling black brew must make a DC 16 Fortitude save or become nauseated for 1d6 rounds and take 1d2 Strength damage. Those who fail the saving throw vomit up the mixture, rendering it useless.

Anyone who succeeds on the saving throw metabolizes the brew and forms an empathic link with the shoggoth the brew is concocted from. This empathic link has a radius of 1 mile and allows the creature to sense the shoggoth's presence and its general physical condition. The link also makes the creature immune to all *confusion* spells and effects, and it eliminates the risk

of the creature being attacked by the shoggoth the brew is concocted from or any gibbering mouters it has spawned. Those who successfully drink shoggoth brew gain 1d4 random physical or mental changes and cannot directly harm the shoggoth the concoction comes from. Indeed, some become even more fanatical in their devotion to the terrible beast.

The effects of *shoggoth brew* are non-magical and cannot be dispelled. A *remove disease* spell cast on the victim breaks its effects, though any marks remain.

Construction

Requirements Craft Wondrous Item;

Cost 375 gp

Variant Shoggoths

Despite their physical mutability, most shoggoths are identical in power and abilities, their reproductive cycle leading to physically identical children. Some variations in form and shape exist, and the most common variants are neo-shoggoths and proto-shoggoths.

Neo-Shoggoths: A new breed of shoggoth created by the derro (see “Ecology of the Derro” in *Kobold Ecologies*), neo-shoggoths have greater control over their bodies and can form slashing blades or piercing spines with their pseudopods. In addition, neo-shoggoths are more intelligent (with Intelligence scores of 10 or more) and can use their maddening cacophony in other, more dreadful ways such as demonic summonings, black rituals that warp space, and luring, hypnotic strains of baleful music that cause fear or insanity. Neo-shoggoths are still relatively rare and can only be found in the largest derro communities.

Proto-Shoggoths: Before the aboleths turned their arcane arts toward the shoggoths, they were little more than massive mounds of unthinking ooze driven by the basest destructive impulses. Some proto-shoggoths still roam the deepest and most inaccessible ocean depths or subterranean reaches, but most have been replaced by the far more dangerous true shoggoths.

Proto-shoggoths possess the powers

of 15 HD black puddings but without the black pudding’s highly concentrated acid, or the maddening cacophony power of regular shoggoths. Like shoggoths, they can constrict, engulf, and trample creatures, and random physical features in their otherwise amorphous pudding-like bulks include eyes, mouths, and strange malformed organs such as beating hearts or weeping bile ducts.

New Shoggoth Abilities

Neo-shoggoths, as well as ancient shoggoths, or those found on other worlds or planes sometimes possess abilities different from the norm. Some of these variant abilities are listed below.

Blood Drain (Ex) To make a shoggoth more like a gibbering mouter, a GM might want a shoggoth to drain blood from a victim instead of dealing acid damage. A blood-draining shoggoth does not deal acid damage with its engulf ability but instead deals 6 Constitution damage per round. As with the gibbering mouter’s blood drain ability, the shoggoth does not affect creatures without blood such as constructs and elementals. This ability increases the shoggoth’s CR by +1.

Breath Weapon (Ex) The shoggoth can breath out a 30-ft.-cone of acidic vapor once every 1d4 rounds as a standard action, dealing 15d6 acid damage to all creatures struck (Reflex save for half). The DC for the breath weapon is Constitution-based (Reflex DC 31 for an average shoggoth). This ability increases the shoggoth’s CR by +1.

Spell-like Abilities (Sp) The shoggoth possesses 20 spell levels’ worth of 1st-3rd level spells useable 3/day, and 20 spell levels’ worth of 4th-7th level spells useable once/day. This ability increases the shoggoth’s CR by +1.

Terrifying Cacophony (Su) Instead of the normal confusion effect, the shoggoth’s cries frighten those who fail their save. This effect lasts 1d6 rounds. Those who succeed on the saving throw are shaken for the same number of rounds but cannot be affected by the terrifying cacophony again for 24 hours. This ability does not increase the

shoggoth’s CR.

Whispers from Beyond (Su) The shoggoth can direct its maddening cacophony at a single target within 60 ft. as a standard action. Any creature affected by the maddening cacophony (Will save DC 22 negates) is treated as if under the effects of an *insanity* spell and remains confused indefinitely until cured. A shoggoth that uses its maddening cacophony this way cannot use it against other creatures in the same round. This ability does not increase the shoggoth’s CR.

Shoggoth Lore

Characters with ranks in Knowledge (dungeoneering) can learn more about shoggoths. When a character makes a successful skill check, reveal the following lore, including the information for lower DCs. Since shoggoths are extremely rare creatures, the baseline Knowledge DC to discover anything about them is 34 (15 + the shoggoth’s CR of 19).

Table: Shoggoth Lore

DC	Result
34	Shoggoths are monstrous oozes that live in inaccessible regions of the world, particularly polar oceans and underground caverns. Shoggoths are vaguely intelligent and can constrict, engulf, and trample their prey. They can also produce a maddening array of sounds that drive creatures insane.
39	Gibbering mouters and shoggoths are distantly related. Bizarre cults dedicated to shoggoths exist, and they are usually made up of primitive humanoids, humans, or derro. Shoggoths speak the secret language Aklo and were once slaves of the aboleth.
44	Shoggoths were created several eons ago by a race known as the elder things. Shoggoths can create gibbering mouters under the right conditions, usually immediately after devouring sentient creatures. Derro cults breed powerful and closely related creatures known as neo-shoggoths.

The ecology of the slithering tracker

by Ed Greenwood

From the notes of the wizard Aluthandee:

It is called by such names as "The Invisible Death" or "The Creature That Follows The Doomed," and other fanciful phrases that suggest a thing of claws, fangs, and scaly limbs. When referred to by its mundane name, the Slithering Tracker is not nearly so imposing — and, indeed, it is not a vicious-looking creature, when it can be seen at all.

Close examination of the beast reveals it to be rather like a giant tadpole in appearance. Its transparent, semi-fluid jellylike body is customarily shaped into a blob with a long, sinuous tail. The body is amorphous, enabling it to pass through small gaps and holes, but it prefers to assume its tadpolelike form whenever possible.

Almost invisible and quite intelligent (especially for a slimelike creature), the tracker will lie in wait for prey in an advantageous location, such as in a cozy, apparently safe sleeping cavern, or at the bottom of a pit trap. It can grip and travel upon walls and ceilings and apparently can drop any reasonable distance without harm because of its form. When it moves, a tracker is almost silent except for the faint slither of its tail.¹ The creature exudes a very faint, sweet, "earthy" body smell, detectable only from inches away. The subtlety of its smell, sounds of movement, and appearance are such that it is virtually undetectable in the dimly lit subterranean areas it inhabits.²

A tracker feeds by first paralyzing an opponent with a fluid produced by its body cells, forcing this liquid into the victim through the pores of its skin, and then using a second fluid to actually erode the hide or skin of its victim, so that the creature can absorb the plasma from the victim's blood. Both the paralyzing substance and the fluid which effects the draining of the victim are produced automatically within the creature's body from any meal the creature consumes, the remainder of its fare being converted to energy for bodily activity, and sometimes being used to make itself stronger or larger. I know of no alchemists who can duplicate either of the tracker's fluids in the laboratory, but they eagerly make use of the former as an ingredient in the inks for the scribing of the paralyzation, *hold person*, and *slow* spells. Assassins, and alchemists in their employ, prize the skin-eating substance for use in the manufacture of caustic poison mixtures. These substances are present in each and every cell of the creature, and not collected in specific

areas or organs; however, they do readily settle and separate one from the other if a trapper's fluids are collected.

Trackers seem to prefer dwarves, humans, and giants as prey, in that order, over other creatures, presumably because of the physical make-up of their plasma.³

A tracker reproduces by budding. When specimens of full size gain further substance, they form excess body cells and place these in a pseudopod. All excess food (unless the parent creature is injured and reabsorbs these needed cells to maintain itself) is converted into more cells for this "bud." Such cells differentiate, and the pseudopod takes on the form of a second, miniature tracker joined to the first. When this is of sufficient size, the tracker produces brain-function cells for it, and these are passed into the "baby," which acquires limited sentience and begins to gain some control over its own form and actions. When it has mastered its form and gained strength, the parent tracker shakes free of it, and, after the initial shock of sudden, total self-control and loneliness, it will go its own way.⁴

Trackers are solitary, never merge with or fight other trackers, and inhabit a specific "territory" or range that they come to know very well, patrolling it regularly and recognizing instantly when some feature of it has changed. The tracker tolerates scavenger creatures who remove the bodies of its victims, but before abandoning a body it attempts to retain loose objects that might be recognized as treasure, so as to lure more prey in the future. A tracker lair is typically a tiny, irregular cavern too small for an attacker to effectively harm its occupant, located at the intersection of beckoning trails of treasure. A tracker can "burrow under" loose objects and carry them along for a distance before depositing them elsewhere, and in certain circumstances might lie dormant with treasure spread on top of itself.

A tracker's brain cells are located in various areas of its amorphous body; it has no special, vulnerable area. It can re-form if its bulk is separated in battle or misadventure, flowing together, or its various pieces attacking in combination, "like fingers of a closing hand," as the fighter Nerouth once put it. Such disembodied pieces will never voluntarily go off to seek their own territories; although they can survive permanently if of sufficient size, they will first seek to re-form once more into the full creature.

A tracker has apparently keen senses,⁵ and once tracking intended prey by scent, will leave its territory and travel several miles, by dint of tenacity and perseverance in pursuit. It can think logically enough to deduce the probable destination of a target if the trail is wiped out by running water, heavy rain, or other means, but will not pursue if a large body of water intervenes, or if its quarry takes to the air.

Trackers seem to have a marked aversion to large bodies of water, but why this is so and precisely what effects water may have

on them are matters unknown to this chronicler. Some sages (Vaelenbras of Waterdeep, for one) believe that trackers instinctively fear strong currents and coastal tides and breakers, which may have the power to tear apart and forever scatter their jellylike bodies, while others (notably Jar-riven of Koss) assert that it is simple prudence: unlike those of the jellyfish, a tracker's fluid defenses may be weakened or dissipated entirely by water, and in such circumstances even small fish could readily devour it. (None of the adventurers I have spoken to will admit to success in neutralizing the creature's paralyzing fluids with water — but then, neither have I ever heard of a tracker being encountered, or attacking an adventurer, when the adventurer was immersed or swimming in water.)

A tracker will move into a heavily populated area if it can find a place for a good lair, where it believes it can remain undetected if it wants to. In pursuit of plentiful prey, it will leave its normal territory without hesitation — but will only do so in pursuit of men or larger creatures, and only out of starvation or desperation, not chasing off after every animal that happens past.

Whether these creatures can hear, and if so, understand speech, is a matter of great and continuing debate among local sages and naturalists. I suspect that they do hear, in a limited way, but no unquestioned proof has been set forth on either side of the debate. Much yet remains to be learned about this creature; my fragmentary researches have led my colleagues to give the creature yet another name — the "Aluthander," after me — and what little I have learned can be set forth on these few pages.

Notes

1. A slithering tracker forms a tail to aid it in rapid movement; the tail propels the creature along with a snakelike gripping and wriggling motion, at a rate of 12" per round. It will also form a tail — or two protrusions, at opposite ends of its body — with which to anchor itself by wrapping around objects, so that it can form a barrier across a hole or a trail to stop and entrap small animals. If it is not employing a tail, a trapper can only "creep" like an ochre jelly, at a rate of 3" per round. It will always form a tail and move faster than 3" per round when it is tracking prey; the tail will "disappear" when the creature attaches itself to a victim, or when the trapper is stationary for longer than one round.

2. Under outdoor conditions, not brilliantly sunlit, there is only a 5% chance of detecting a slithering tracker by normal visual means. This chance increases by 45% when the creature is on clear sand or stone of a solid color under bright sunlight. (Subtract 5% or 10% if the undersurface is mottled in hue or appearance, and further 5% increments as the light grows fainter or more diffused by overhead foliage, and for other conditions that inhibit full normal visibility.) A tracker is thus, at best, only detectable on a 50% chance — under

optimum conditions — to anyone not having a means of detecting or contacting an animal mentality, or the ability to detect invisible (in this case, transparent) objects or creatures. No tracker will voluntarily put itself in such optimum conditions — few will even venture outdoors at all, if they can help it — and the chance for detection is usually much lower than the optimum 50%. A trapper's body takes on the same temperature as its surroundings; as such, the creature is not detectable by infravision except during one of its attacks, or for a period of one turn (10 minutes) after it has drained plasma from a victim.

3. A tracker requires 6 uninterrupted turns to entirely drain a paralyzed victim. It will not attempt its plasma-drain attack against a conscious target who makes a saving throw vs. paralyzation and is thus still mobile; in fact, it will not attempt to make contact with conscious, mobile targets of halfling-size or larger unless it is starving

A tracker will move into a heavily populated area if it can find a place for a good lair, where it believes it can remain undetected if it wants to.

and desperate. If this happens, a mobile victim can easily and quickly (by pulling, scraping, burning, etc.) break a tracker's draining contact, leaving only a red, tender, non-bleeding area where contact with the tracker has resulted in the loss of skin layers. This reddened area is usually no larger than the circle described by an outstretched hand, and this is roughly the amount of exposed skin that must be available for the tracker to attach itself. The slithering tracker does not wrap itself around a victim, except possibly to curl its body around a patch of exposed skin on an arm, leg, or face; and it does not attach itself along the entire contacting surface of its body, even if a large area of exposed skin (such as a bare torso) is available. This is the main reason why it can be detached with relative ease.

A tracker will always attack sleeping or unconscious targets in preference to other sorts. A victim who is sleeping normally (not under a magical effect) will awaken on

the round when the tracker attaches itself, whether or not the victim saves vs. paralyzation. An unconscious victim will not revive as a result of the tracker's attack, unless the victim would have regained consciousness anyway at some point during the 6-turn time span of the plasma drain. A victim who suffers the plasma drain will lose one-sixth of its then-current total of hit points at the end of every full turn following the onset of the attack (round fractions up) — for 5 consecutive turns; assuming the plasma drain continues uninterrupted. At the end of the sixth turn, the victim loses all remaining hit points down to zero. The tracker will detach itself at this point, and if unaided the victim will continue to lose hit points at the rate of 1 per round thereafter until one more turn has passed, at which point the victim (assuming a character or other humanoid) is dead.

The creature can always tell whether or not its paralyzation attack has succeeded,

tracker if a target meets the creature more than one day after the initial encounter.

4. "Full size" in this context means a creature with 5 hit dice, or 23+ hit points. A "baby" of 2 hit dice, or 9+ hit points, is of sufficient size to acquire brain cells and limited sentience. The production of a pseudopod and specialized brain cells is instinctive when the creature is under the right conditions — but only a full-sized tracker of 5 HD can reproduce in this fashion. A parent instinctively parts from its pseudopod when the latter achieves 3 hit dice size, or 14+ hit points.

If a tracker is split into two or more smaller portions, its disembodied pieces will seek to re-form if possible, searching around in a small area (about 12" diameter) for their fellows. These disembodied pieces can survive if of 2 hit dice (9+ hit points) or more, but if less than 2 hit dice, they will die in 12-31 (d20 + 11) turns from lack of a sufficient number and balanced order of

die. When at rest, the body is in a flattened spherical shape; when in motion, it takes on a teardrop shape, bulkier at the leading edge. The tail which the tracker sends out to aid it in movement is in addition to its body length, tapering away from the direction of movement for a length of 4 or 5 feet in a full-grown specimen. The tracker cannot make abrupt changes of direction while in motion; to reverse its course, or even to make a 90-degree turn, it must come to a full stop for one round and then start off in the new direction. When one is trapped or cornered, it will make the best possible use of its natural defenses (transparency, body flexibility, and near-silent movement) to attempt an escape.

B. Even if a tracker is detected once, that doesn't mean the creature will remain visible indefinitely. It is easier to see when it is moving (add +10% to +20% to the base chance of detection, depending on lighting and terrain), but still may be able to slip away from an attacker. It is very difficult to keep track of a tracker long enough to kill it with normal weapon blows, since several different strikes over a span of several rounds would be needed. One effective tactic is to immobilize the creature with *hold monster* or similar means, then successfully detect it where it lies (if that is not already known) and smash away. Of course, the tracker's natural transparency can be easily offset by dousing it with dye or covering it with soot or dust; this will not suffocate the creature or inhibit its movement, but will certainly make it visible to anyone within sighting range.

C. Two events can cause a tracker to be split apart in battle; in either case, a hit from a slashing weapon (short sword or larger) is required. If an attack roll is one less than the minimum number needed to score a hit, the tracker takes no damage but is split into two creatures of identical size and hit points. Or, if a hit succeeds and does at least 6 points of damage, the creature is split into two equal-sized pieces, each with half of the remaining hit points (assign odd hit points to one half or the other). Example: A tracker of 5 hit dice, with 26 hit points, is cleaved in half by a blow from a longsword that does 8 points of damage. The result is two smaller creatures with 9 hit points each, now effectively 2 HD monsters (figuring $4\frac{1}{2}$ hit points = 1 hit die).

Note that when a tracker is forming a pseudopod, the entire body of the creature may have more hit points (and, effectively, more hit dice) than would otherwise be normally possible. A 5 HD tracker with maximum hit points (40) could form a pseudopod and nurture that tracker-to-be, until the "baby" acquires 14 or more hit points, at which time it will separate from the parent. In the meantime, the reproducing tracker would be treated as a monster of as many as 7 hit dice, with a possible maximum of 53 hit points.

D. A tracker can gain new hit points (or regain lost ones) by draining plasma from a victim, at the rate of 1 hit point per turn of

The tracker cannot make abrupt changes of direction while in motion; to reverse its course it must come to a full stop.

and it will not attempt to begin draining the plasma from an intended victim who makes his saving throw; instead, it will move away as rapidly as possible, trying to get out of range of a sleeping target before it awakens. The save vs. paralyzation — which any intended victim is entitled to — represents the chance that the intended victim has a temporary immunity to the tracker's fluids, because of the target body's present chemical balance, and because of the target's innate resistance to paralyzation attacks; this natural resistance is stronger for those of relatively high levels of experience or large numbers of hit dice. A target that has proven to be immune for the moment will not have to save again during the same engagement, and a tracker (unless desperate) is not foolish enough to attack the same victim twice in rapid succession. But if a target is attacked twice by different trackers, he must save twice to remain unaffected. A second save is required against the same

body cells. Such "doomed" fragments will be ravenously hungry, instinctively seeking sources of plasma, and will attack all likely targets encountered (conscious or not) without caution — for if they absorb enough plasma, they may be able to grow to a stable size and survive.

5. Trackers have no eyes as such, but possess an infravision sense that enables them to locate warm-blooded bodies in a 6" range. They are fairly keen receptors of odor, able to home in on body scents from 12" away with enough accuracy to discern the general direction they must take to keep on tracking their prey. They can sense even faint vibrations up to 16" away, even something as innocuous as the tapping of hard boots (but not soft ones) on a stone floor.

Appendix

A. The standard body size for a slithering tracker is 2½ feet, or (for smaller specimens) roughly ½ foot of length for every hit

draining. (The rest of the plasma is simply used to enable the creature to "eat its fill" and maintain normal bodily functions.) Depending on its size (number of hit dice), each tracker has a maximum number of hit points it can attain. This figure is determined by rolling a die or dice every time the tracker qualifies to grow into a larger hit-dice category. The creature can then absorb hit points from its plasma drain until it attains that maximum figure. If a tracker has taken damage, "plasma points" are first applied to bring the creature back up to its maximum number of hit points. When there is no damage to be offset, these points may be used (by a 5 HD creature) to begin or accelerate the formation of a pseudopod, feeding it until it acquires 14 hit points (3 x 4½, rounded up) and thereby qualifies as a 3 HD monster that can live on its own. Hit points that cannot be applied for one of these specific purposes are simply "wasted."

Example: A tracker pseudopod has just reached 14 hit points and separated from its parent. The DM rolls 3d8 to determine the maximum number of hit points this creature can attain as a 3 HD monster; if the result is 14 or less, then the tracker is already at its maximum strength and will never grow any larger. If the dice roll is 15, 16, or 17, then that is the creature's maximum hit-point figure, and it can never be more than a 3 HD monster. If the roll is in the range of 18 to 22, the creature is able to attain that many hit points and, upon doing

so, will qualify as a 4 HD monster. Upon reaching 18 or more hit points, the tracker is entitled to another d8 roll for additional hit points, and if the total of all the rolls is 23 or more, the creature will eventually be able to attain status as a full-sized 5 HD monster. Finally, when it gets to 23 hit points, it is entitled to one more d8 roll to determine the absolute maximum number of hit points it can attain. Note, again, that only a 5 HD tracker has the ability to form pseudopods and reproduce.

E. In general, the intensity of a tracker's appetite depends on how many hit points it currently lacks to fill its needs. A wounded creature, despite its condition, will be obsessed with bringing itself back to full strength — and trackers do *not* regain lost hit points by resting. As stated in note 4 above, tracker fragments of less than 2 HD will be ravenous, since they literally need food to have a chance of surviving. A tracker that is not wounded but has not yet attained its maximum potential strength (see the example in the preceding section) will hunger to do so, and will leave its territory in pursuit of prey. A creature currently at its maximum strength will not be eager to take chances, but won't turn away from a meal. In any event, a tracker must consume a full meal (one M-sized creature worth of plasma, or more) once per month, or it will lose hit points at the rate of 1 per day as its body begins to atrophy. And the more hit points it loses, the hungrier it gets. . . .

CAST YOUR OWN FANTASY FIGURES

SPECIAL OFFER

For only \$9.95 (postpaid) you can get our \$15.95 fantasy starter set. It has everything you need to cast your own figures. Get in on the fun...

We now have 13 super fantasy molds with 39 great characters.

Casting your own figures is as much fun as playing the game.

Send \$1.00 for complete brochure (refundable).

CASTING IS EASY AND FUN

DAREDEVILS™

HAVE ADVENTURES!

You can too! **DAREDEVILS** is a game of role-playing action and intrigue set in the 1930's. Players design and develop their characters who may be investigative reporters, private investigators, globe-trotting soldiers-of-fortune, mysterious cloaked crimefighters, or any of the heroes fostered by the popular culture of the era. The Gamemaster incorporates these characters into fast-paced adventures full of master villains, mysteries, fog shrouded streets, furious gun battles, and cliff-hanger escapes.

So, come and join the adventures.
Become a Daredevil!

DAREDEVILS comes as a boxed set that includes the rulebook, a referee's screen with useful charts and a political map of the world, and **DAREDEVIL ADVENTURES**. This last is a collection of four adventures which allows you to begin play with a minimum of preparation.

The boxed set is available for only \$15.00.

ALSO AVAILABLE:

- **Daredevil Adventures 1: featuring Deadly Coins**
- **Daredevil Adventures 2 with Menace Beneath the Sea**
- **Daredevil Adventures 3: Supernatural Thrillers**

Each adventure is \$5.00

Lands of Adventure™

A new and exciting Fantasy Role Playing Game with add-on culture packs to adapt the basic rules to various cultures from both history and myth. The basic rules cover everything from character creation and advancement to combat, skills, and magic. Cultures are fully explained for detailed and believable worlds.

The basic game comes as a boxed set including the basic rules, character sheet, and a double culture pack describing the worlds

of Medieval England and Mythic Greece.

Each Culture pack also includes scenario and adventure outlines.

Lands of Adventure is a complete adventure role playing game for only \$12.00.

Available from local shops or direct from us:
P.O. Box 182,
Roslyn, N.Y. 11576

Please add \$2 for postage

New York residents, please add sales tax.

"For it is of old rumour that the soul of the devil-bought hastes not from his charnel clay, but fests and instructs the very worm that gnaws; till out of corruption horrid life springs, and the dull scavengers of earth wax crafty to vex it and swell monstrous to plague it. Great holes secretly are digged where earth's pores ought to suffice, and things have learnt to walk that ought to crawl."

—H. P. Lovecraft, "The Festival"

THE ECOLOGY OF THE

SPAWN OF KYUSS

The journals of Anadan the Reader make for singularly depressing yet morbidly intriguing study. An enthusiastic member of the crusading knights known as the Scions of the Hale, Anadan's surprisingly literate account of his group's encounters with the unliving contain valuable information on the behavior, combat tactics, and weaknesses of no fewer than seven undead breeds. Unfortunately for Anadan, it was this seventh undead, the spawn of Kyuss, that would prove to be not only his end, but the end of the Scions of the Hale. The last several pages of his worm-eaten journal tell of how his company was ambushed by a group of these horrific monsters, and how their very appearance drove fear into the hearts of many of his companions. Those who fled the combat were the lucky ones—they were able to live the rest of their humbled lives as broken men. The three who stayed to fight, including poor Anadan, managed to destroy the spawn, only to succumb, one by one, to the worms that infested their bodies during the battle—worms that leapt

and lunged from the undead flesh of their enemies to burrow hungrily into living meat.

Anadan tells of how one soldier cut off his own arm at the shoulder to try to stave off the gnawing approach of a worm, only to bleed to death as a result. The other man, Anadan's captain, fled into the mist-cloaked bog and for the next several pages, Anadan writes of how the man's screams grew more and more frantic and incoherent until they suddenly ceased. Throughout the entire account, Anadan writes of how he can feel the worms inside him burrowing through his body. Anadan was not lucky enough to have an arm to lop off. His worms swam through his torso, upward, into his neck. The reader can see in his text when the worms reached his brain, for his writing slowly grows sloppy, his ability to spell degrades, and his very vocabulary becomes stunted and almost illegible as the teeming intruders did their hungry work. His last words (for by this point he had apparently lost the skill to scribe complete

sentences) are particularly chilling: "...captain... back... he see me... drool... not drool... worm... chew... no... me live... not want die... hurt... hrrrrttt... hhungrrreee..."

Scholars and priests often refer eager adventurers who inquire about the undead to the journals of Anadan the Reader, for if they aren't warned off by Anadan's doom, they might learn a thing or two about perhaps the most terrifying and relentless enemy they'll ever face.

HISTORY OF THE SPAWN

The spawn began with Kyuss, an ancient priest of a forgotten deity who ruled an empire before the advent of modern civilization. Little remains in writing of the details concerning Kyuss and his rule, but it seems clear his skill at creating undead was unsurpassed. Eventually, the necromancer-priest vanished into parts unknown, leaving in his wake an empire of the dead. Yet while relatively little information survives to inform the modern scholar about the man himself, of his spawn much has been documented.

KNOWLEDGE OF THE SPAWN OF KYUSS

The following table shows the results of a bardic knowledge or Knowledge (religion) check related to the spawn of Kyuss. Any cleric, graveyard keeper, or scholar of necromantic arts might know some or all of this information, although those who don't know the true nature behind these undead sometimes (unintentionally) spread inaccurate information about them (as evidenced by information provided for a DC of 10).

Knowledge (religion)

DC	Result
10	Some zombies are just plain harder to kill than others. You can tell the really tough ones by the worms that infest them. Their wounds close up as fast as you can hack them apart.
15	Worm-infested zombies are dangerous, for there's a good chance such a monster is in fact a spawn of Kyuss, a disease-festering menace whose writhing green worms can transform those they infest into undead horrors.
20	A spawn of Kyuss exudes a supernaturally potent aura of fear. Worse, their touch not only infects victims with a terrible disease known as Kyuss' gift, but it can also infest others with the worms that gnaw on their bodies. The touch of silver and deft hands might pluck these worms away before they burrow into a victim's brain.
25	Magic that removes curses or diseases can save someone infested with the worms of Kyuss even if they have reached the victim's brain. Such a magic effect directed at the spawn itself can transform all but the most powerful into normal zombies.
30	Some of Kyuss' spawn are much more powerful than the typical spawn and possess strange powers like the ability to exhale clouds of noxious grave wind or the ability to spray the surrounding area with infectious worms. Not all spawn of Kyuss are humanoid in shape and might infest a variety of natural and monstrous forms.

The first reports of free-willed spawn of Kyuss came from adventurers who dared explore a forgotten and shadowed spur of the great Rift Canyon. Known now as the Wormcrawl Fissure, this region is reputed to have once been the seat of Kyuss' power. Certainly, the area was infested with his spawn. Strangely enough, explorers in the Amedio Jungle to the south began to report encounters with identical creatures in the western reach of the jungles.

As time wore on, the spawn began to appear in other regions as well, usually in large urban areas. These spawn were spread deliberately by cultists who proclaimed that Kyuss himself had not vanished from the world. Indeed, they believed that he had become a god, and it was their duty to spread his spawn throughout the world to herald his imminent return.

NECROLOGY OF THE WORM

Like most undead, the spawn of Kyuss have a host of potent supernatural abilities. They radiate fear, they cause disease with a touch, and they heal damage to their undead flesh with shocking speed. Yet their most notorious and fearful aspect isn't properly a feature of their undead bodies at all, but is in fact the source of their scourge.

The green worms that infest each spawn of Kyuss are not themselves undead. Rather, they are a strange symbiotic form of vermin that subsists upon the decaying flesh of the spawn. The worms are voracious, but as fast as they consume the flesh of their host it regrows and replenishes. Theoretically, if a spawn of Kyuss could be separated from its infesting host, its fast healing would increase dramatically. Fortunately, the spawn themselves are inexorably tied to their wormy symbiots and without one the other quickly dies. The spawn's flesh provides sustenance for the worms, while the worms provide—in some unknown way—the animating energies the spawn requires to exist.

Scholars and necromancers have long been fascinated with these worms. None have managed to keep a spawn animate after harvesting its

worms but the reverse is a simple task. A Kyuss worm plucked from the body of its host can survive for several minutes before it melts into a reeking green stain. At one end, the worm is a gaping toothy hole of razor-sharp teeth set in concentric rings around the inside of the throat. A Kyuss worm on the ground is nearly helpless; it cannot slither, instead moving impotently by violently flopping its body. A Kyuss worm goes dormant indefinitely if stored in a *potion of gentle repose*, yet rumors hold that the cult of Kyuss has perfected methods of hiding worms in other liquids as well.

When a Kyuss worm contacts living flesh, it enters a state of violent excitement. The worm's mouth unfolds around itself, turning inside-out and prolapsing so that the teeth along its throat become concentric rings of outward-pointing teeth that take up half its length. These rings of teeth then twist back and forth with such ferocity that

the worm can drill through flesh and even bone with nauseating swiftness, slithering through tissue like a metal screw through soft wood. Although itself mindless, the worm's lower reaches are sensitive to nervous tissue and can feel the transmission of pain created from its fleshly burrowing as it is transmitted through the nervous system to the victim's brain. The worm follows these transmissions like a roadmap, unerringly arriving in the creature's brain only a few moments later.

Once the worm reaches the brain, its mouth reverts to its normal state and it begins to consume, slithering its way at random through the victim's mind as it consumes his memories, personality, and horror-filled final thoughts. The victim soon dies and the worm immediately begins to multiply inside the body's now empty skull via an unnaturally swift asexual process. As the number of worms exceeds the skull's capacity, they burst from the victim's mouth, eyes, nose, and ears. It is at this moment that the supernatural vermin transform the body into a new spawn of Kyuss. Additional worms immediately begin feasting on the victim's flesh and organs, while the original clot of writhing symbionts remain lodged in the undead creature's skull. While individually unintelligent, the worms retain corrupted fragments of the original creature's intelligence and memories. This nest of worms serves the creature as an unholy replacement for the devoured brain. Although this hivemind usually possesses only a fraction of the original creature's intellect, it is more than enough to give the spawn of Kyuss a sinister cunning and drive it to spread its taint among new victims.

CREATING A SPAWN OF KYUSS

Any evil cleric can create a spawn of Kyuss by casting *create undead* as long as he is at least 15th level. The material component for creating a spawn of Kyuss, however, is slightly different than normal. This version of the spell must be cast over the grave

KYUSS

Demigod (Neutral Evil)

Once an obscure deity associated with creating and mastering the undead, Kyuss and his cult are rising in prominence with the coming of the apocalyptic Age of Worms. Classically, his appearance has been likened to a gaunt man with hands of bone and eye sockets filled with writhing worms, but many religious scholars believe that Kyuss has shed all remnants of his once mortal body, and is now composed entirely of a humanoid-shaped mass of writhing green worms.

Symbol: A human skull with green worms writhing from the eye sockets and jaw.

Portfolio: Creation and control of the undead, decay, unholy transformation of the flesh, worms.

Domains: Corruption*, Death, Destruction, Evil.

Favored Weapon: Club.

Clerical Training: New cultists must drink a *potion of inflict light wounds* that contains a preserved Kyuss worm in a deadly ritual known as First Ingestion.

Quests: Kyuss encourages his cultists to not only lure powerful individuals to his fold but to trick members of other cults and religions into furthering his unknowable goals.

Prayers: Servants of Kyuss offer their prayers on a personal level once a month in a rite involving the ingestion of living worms.

Temples: Huge subterranean cathedrals and tabernacles dedicated to Kyuss exist in remote locations far from civilized lands.

Rites: Kyuss' cult anticipates the return of their god, a time they call the Age of Worms. In preparation, cultists undertake a variety of vile missions ranging from the creation of spawn of Kyuss to world-spanning manipulations.

Herald and Allies: Kyuss' herald is a undead terror known as Dragotha, once a red dragon and consort to Tiamat. Kyuss most commonly sends demons that bear the favored spawn of Kyuss template in response to *planar ally* spells.

* Consult the *Book of Vile Darkness* (mature audiences only).

worm's direct interest. In recent years appearances of the favored spawn have risen, evidencing the impending Age of Worms.

of a killer who was buried without a coffin in unhallowed ground (a DC 25 Knowledge [local] check can usually determine if such a body lies near a specific settlement). If the caster has a preserved or live Kyuss worm he may substitute that for the 250 gp black onyx gem that is otherwise required to animate the body. As the spell is cast, the grave blooms with worms and maggots as the newly created spawn of Kyuss rises from within. Favored spawn of Kyuss cannot be created with this spell or with *create greater undead*; the secrets of their creation

reside only with Kyuss and his most trusted minions.

FAVORED SPAWN OF KYUSS

While the spawn of Kyuss are bearers and victims of their master's corruption, those who garner the demigod's favor are blessed by worms. Former fanatics, crazed visionaries, and purposefully sacrificed beasts, these favored spawn of Kyuss wreak his terrible will with an array of corruptive abilities. Found either alone or enslaved to the service of mad prophets, favored spawn take a vast array of forms and imply the demigod of

An unnaturally mangy mastiff skulks forward, much of its fur and flesh having fallen away leaving gaping, diseased holes. A sickly green light streams from its empty eye sockets and strands of writhing green worms replace drool in equally copious ribbons.

Plague-spreading hunters and harbingers of the demigod of worms, mastiffs of Kyuss stalk the enemies of their master's favored servants. Tireless and riddled with deadly Kyuss worms, a single mastiff might range over hundreds of miles, inevitably striking a single target with

precision or seeding its god's ruinous corruption throughout an entire offending town.

COMBAT

Mastiffs of Kyuss are barely-thinking killers, slaves to the wills of their masters. Their method of combat varies greatly depending on their commands, using their create spawn ability, fighting alongside pack mates, or avoiding confrontations depending on their orders' dictates. Mastiffs without instructions, however, know only the compulsion to spread their god's taint and seek to use their create spawn ability as often as possible.

Create Spawn (Su): Once per round as a free action, a spawn of Kyuss can transfer a worm from its own body to that of an opponent. See the following template for a complete description of these effects.

Fear Aura (Su): A mastiff of Kyuss continuously radiates a fear effect. All creatures within a 40-foot radius must make a DC 13 Will save or be affected as if by the spell *fear*. Any creature that makes a successful saving throw against the effect cannot be affected again by the fear aura of the mastiff of Kyuss for 24 hours.

Smite Good (Su): Once per day a mastiff of Kyuss can make a normal melee attack to deal 2 extra points of damage against a good foe.

Infested Skin (Su): A mastiff of Kyuss is so infested with worms that any creature that strikes it with an unarmed strike, natural weapon, or light weapon must make a Reflex save or a Kyuss worm is transferred to the attacker's body. Any creature that shares the same square of the mastiff (such as might occur during a grapple, bull rush, or Tumble check)

must make a Reflex save to avoid the same fate.

CREATING A FAVORED SPAWN OF KYUSS

"Favored Spawn of Kyuss" (known simply as the "favored" to cultists of Kyuss) is an inherited template that can be added to any living, corporeal creature. A favored spawn uses all the base creature's statistics and special abilities except as noted here.

Size and Type: The creature's type changes to undead. Do not recalculate Hit Dice, base attack bonus, or saves. Size is unchanged.

Special Attacks: A favored spawn retains all the special attacks of the base creature and also gains the following special attacks.

Create Spawn (Su): Once per round as a free action, a favored spawn of Kyuss can transfer a worm from its own body to that of an opponent. It can do this whenever it hits with a natural attack or an unarmed attack, but it can also make the transfer by means of a successful melee touch attack or a ranged touch attack, hurling a worm at a foe from a distance of up to 10 feet.

Each worm is a Fine vermin with AC 10 and 1 hit point. It can be killed with normal damage or by the touch of silver. On the spawn's next action, the worm burrows into its host's flesh. A creature with a natural armor bonus of +5 or better is immune to this burrowing effect. The worm makes its way toward the host's brain, dealing 1 point of damage per round for 1d4+1 rounds. At the end of that period, it reaches the brain. While the worm is inside a victim, a *remove curse* or *remove disease* effect destroys it, and a *dispel evil* or *neutralize poison* effect delays its progress for 10d6 minutes. A successful DC 20 Heal check extracts the worm and kills it.

Once the worm reaches the brain, it deals 1d2 points of Intelligence damage per round until it either is killed (by *remove curse* or *remove disease*) or slays its host (death occurs at 0 Intelligence). A Small, Medium, or Large

creature slain by a worm rises as a new spawn of Kyuss (not a favored spawn) 1d6+4 rounds later; a Tiny or smaller creature quickly putrefies, and a Huge or larger creature becomes a normal zombie of the appropriate size. Newly created spawn are not under the control of their creator, but they usually follow whatever favored spawn of Kyuss created them.

If a creature is infested with multiple worms, a single *remove curse* or *remove disease* destroys all the worms infesting the creature at once.

A favored spawn attacking a helpless opponent may use its foul embrace ability instead of this ability.

Fear Aura (Su): A spawn of Kyuss continuously radiates a fear effect. This ability functions like a *fear* spell (caster level 7th, Will save DC 14 + the favored spawn's Charisma modifier), except that it affects all creatures within a 40-foot radius. Any creature that makes a successful saving throw against the effect cannot be affected again by the fear aura of that favored spawn of Kyuss for 24 hours.

Foul Embrace (Su): By pressing its face against a helpless victim, the favored spawn of Kyuss can infest the victim with a rain of 2d6 worms. This ability is treated the same as the create spawn ability, but a victim slain by the resulting infestation rises as a favored spawn of Kyuss rather than a normal zombie.

Kyuss' Gift (Su): Any creature hit by a favored spawn of Kyuss' natural attack or unarmed attack must succeed at a DC 12 Fortitude save or contract this supernatural disease. The incubation period is 1 day, and the disease deals 1d6 points of Constitution damage and 1d4 points of Wisdom damage. These effects manifest as rotting flesh and dementia. An affected creature gets only half the benefits of natural and magical healing, though a *remove disease* effect removes the affliction.

In addition to the previously described abilities, a favored spawn with 10 HD or more gains one of the following additional special attacks

as a gift from Kyuss himself. Saving throws against these effects are against a DC of 10 + half the favored spawn's Hit Dice + the favored spawn's Charisma modifier.

Infested Skin (Su): The favored spawn of Kyuss is so infested with worms that any creature that strikes it with an unarmed strike, natural weapon, or light weapon must make a Reflex save or a Kyuss worm is transferred to the attacker's body. Any creature that shares the same square as the favored spawn (such as might occur during a grapple, bull rush, or Tumble check) must make a Reflex save to avoid the same fate.

Noxious Breath (Su): Once every 1d4 rounds, as a standard action, the favored spawn of Kyuss can exhale nauseating vapor from its mouth in a 15-foot cone. All creatures in this area must make a Fortitude save or be nauseated for 1d4 rounds.

Wormburst (Su): Once per day as a standard action, the favored spawn of Kyuss can expel a 10-foot-radius burst of worms from its body. All creatures in this area of effect must make a Reflex save or become infested by 1d6 Kyuss worms.

Special Qualities: A favored spawn retains all the special qualities of the base creature and gains the following.

Damage Reduction (Ex): A favored spawn of Kyuss gains damage reduction 5/silver. If the favored spawn has 10 or more Hit Dice, this increases to damage reduction 10/silver.

Fast Healing (Ex): A favored spawn of Kyuss has fast healing 5.

Turn Resistance (Ex): A favored spawn of Kyuss has turn resistance +3.

Abilities: Increase from the base creature as follows: Str +4, Int +2, Wis +2, Cha +2. Favored spawn are undead, and as such do not have a Constitution score.

Feats: A favored spawn of Kyuss gains Improved Unarmed Strike as a bonus feat.

Challenge Rating: +2 (for creatures with 9 HD or less) or +3 (for creatures with 10 HD or more).

Alignment: Always chaotic evil. ☞

AGES OF WORMS

Kyuss and his spawn first appeared in official D&D terms in 1981's *Fiend Folio*. Designed by Michael MacDonald, the nigh-indestructible sons of Kyuss were created by the then priest Kyuss for his own dark purposes. Since then, Kyuss' influence and his namesake minions have spread, appearing in numerous campaign settings, adventures, bestiaries, and—most unexpectedly—as the name of the rock band Kyuss. The minions of Kyuss have taken numerous forms since the *Fiend Folio*'s original sons of Kyuss, appearing most recently in the *Monster Manual II* as the spawn of Kyuss, in *DRAGON* #307 as the scion of Kyuss template, and in this article as the nauseating favored spawn of Kyuss template.

In all of their long history, though, the most epic of Kyuss' plots is unfolding now in *DUNGEON*'s Age of Worms Adventure Path. As foul tidings coincide unlikely heroes stumble upon far-reaching plots of the foul demigod.

Further information about Kyuss, his various spawn and servitors, and their dark plots can be found every month in the pages of *DUNGEON*, *DRAGON*'s ongoing "Wormfood" series, and the massive free *Age of Worms Overload* PDF, available at paizo.com.

The Ecology of the Spectator

A promise made is a promise kept — for 101 years

From *Curiosities of Other Worlds*, volume six, by Mage-Lord I. J. Jijaks of the Free City of Greyhawk:

We now come to spectators, which dwell on the plane of Nirvana in either the Dominion of Lendor¹ or in the land of the modrons. The reader has no doubt read the basic description of these striking creatures in any one of the manuals and tomes that catalog the beasts of this world and others. Having performed the usual research required before summoning and interacting with these beholder-like beings, I am able to share my knowledge in hopes that it will prove to be of use to the reader as well.

Spectators are adapted to equal amounts of light and dark, heat and cold, and liquid and solid terrain. (Nirvana is perfectly balanced in all of these qualities.) Spectators have generous lifespans, and most of these creatures live over 1,000 years. Many of these spectators at any given time are guarding objects throughout the Prime Material plane, as they are often commanded to do so by high-level magic-users.

Spectators are summoned by the casting of a *monster summoning V* spell, accompanied by the sacrifice of at least three beholder's eyes. During the sacrificial rite, the beholder's eyes must first be annihilated — that is, the eyes must be ground into a fine powder, then burned into a black dust. This black dust is then soaked in oil and placed in a special magic circle. Next, the dust is set aflame. Finally, while the eye dust is still burning, a small bag is placed in the center of the magic circle and *monster summoning V* is cast by the magic-user. (The burning eye dust is used as a material component instead of a candle.) The bag opens a small one-way *gate* from Nirvana to the plane on which the spell is cast.

Three segments later, there is a chance that a spectator appears in the center of the magic circle; for each beholder's eye so sacrificed, there is a 10% chance that a spectator is summoned (thus, a base chance of 30% for three eyes). Three segments after the spell has been cast, the *gate* closes again. If summoned into a properly created magic circle, the spectator awaits instructions from its summoner (which invariably entail the guarding of some item or location). Inside this magic circle, the spectator is powerless to *teleport* to Nirvana, leave the circle physically, or use any other powers besides *levitation*. If the circle has not been created properly or if the circle is somehow broken before the spectator promises to complete its job, it *teleports* back to Nirvana. If the summoner gives the spectator a job besides guardianship, the spectator merely states it is unwilling to do so and *teleports* back to Nirvana as soon as the magic circle is broken. Even if the spectator is given a task concerning guardianship, it will instead *teleport* to Nirvana unless it actually promises to fulfill its task.

Spectators dislike guarding for beings of

lesser races (i.e., the races of their human or demi-human summoners), so they always try to avoid such guardianship. However, a spectator will not return to Nirvana after it has made a promise to anyone, because of its lawful-neutral alignment; breaking a promise is considered chaotic behavior. A spectator prides itself on its guardianship and will refuse if a summoner tries to force it to do a job other than guarding. From the spectator's viewpoint, it is not lawful for the summoner to force the spectator to perform a job other than guarding, as spectators should be summoned only to guard.

Once the spectator takes its mission of guardianship, the summoning magic-user deliberately breaks the magic circle and frees the spectator, allowing it to move over to the treasure to be guarded. The creature is free after 101 years to return to Nirvana. A *permanency* spell has no effect on the circle or the duration of the spectator's guardianship.

As a guardian, a spectator's loyalty to its summoner's commands is absolute; it will guard the place or object for *precisely* 101 years. A spectator always knows when the 101 years of service have expired; this is tracked by the spectator's internal clock, actually a lobe on the spectator's brain that perfectly measures time.

When a spectator is guarding the place or objects to which it has been assigned, it will allow *no one* to pass that place or examine any objects it is guarding. At the time the summoner assigns the task, he can make exceptions to these rules, such as allowing certain individuals to circumvent these conditions. This rule applies even to the summoner himself. If the summoner breaks these rules himself, he will be attacked by the spectator.

When a spectator attacks, it launches spells from three of the four small eyes perched on stalks over its globular body. It also tries to keep out of melee range for as long as possible by using its *levitation* powers. A spectator will *teleport* to Nirvana if all of its eyes have been blinded, but if encountered in Nirvana itself and if all of its eyes have been blinded, the spectator attacks with its toothy maw.²

To a spectator, killing a creature for reasons other than self-defense or duty is viewed as a chaotic act. Under a spectator's sense of justice and law, all creatures have the right to live, so long as they do not interfere with the spectator's duties. If a spectator accidentally kills a creature for reasons other than self-defense, it usually wills itself to die, directing its brain's powerful energies against itself.

Spectators have two social classes, upper and lower. Lower-class spectators live in otherwise uninhabited sections of Nirvana in the Dominion of Lendor or in the "modron disk," each residing alone in a small, vertical cave which is dug out with the spectator's mouth. Upper-class spectators are those who directly serve Lendor or serve as guards for the modrons. These

spectators are more lawful and philosophical than their lower-class counterparts because they have usually been educated by their masters to uphold their ideals. In order to become a guard for the modrons, a spectator must *paralyze* a modron rogue unit (using one of its attack eyes) and turn it over to the local pentadrome regimental headquarters (the modrons' law enforcers). Lendor chooses only the most powerful and intelligent spectators to serve him.³

Unlike modrons, spectators are not completely lawful neutral, although upper-class spectators come very close to this ideal. Lower-class spectators have slightly lawful-good tendencies, while upper-class spectators are more strictly lawful neutral. Because of its personal honor, a spectator will not attack a *paralyzed* or helpless enemy unless the spectator was attacked by trickery or by very cruel means.

Spectators have little personal ambition; perhaps their only true goal in life is to serve the forces of law as well as possible. Since modrons are completely lawful neutral, most spectators want to serve the modrons. The greatest pleasures of a spectator (and perhaps its only pleasures) are to thwart chaos, especially modron rogue units, and to guard and defend.

What little is known of the internal anatomy of the spectator is presented here as well. This information on its most unique body organs was collected from the works of several wizards and priests who voyaged to Nirvana and took part in the dissection (with permission) of a spectator slain by a rogue modron unit.

Levator magnus: The levator magnus is a small, highly magical sphere in the center of the spectator's brain (which itself lies at the center of the spectator's round body). This organ gives the spectator its ability to *levitate* in any direction at 100' per minute. No magic negates this effect, although physical forces resulting from magic use (such as those created by a *gust of wind* spell) hamper this activity. The juices drained from this organ are sometimes used as a component in the ink of a scroll of *flying* or *levitation*.

Brain: The spectator's brain has the power to generate a magical force using psionic energy, though the spectator has no true psionic powers as such. This magical force is divided into two branches of power: magical and antimagical. The magical power travels through special nerves to the monster's top four eyes, which convert the power into spell-like effects. The antimagical power is carried by nerves directly to the creature's large eye, causing any spell that strikes the eye to reflect back to the caster. The juices drained from the spectator's brain can be used as a component in the ink of an *anti-magic shell* scroll. (It is to my understanding that the higher sorts of modrons will actually sell or barter the bodies of slain spectators to those who would make use of the corpses for their research, and even some spectators will likewise bargain

away the bodies of their kind.)

Thought-energy enhancer: This organ multiplies the psionic force generated in the brain and relays it to the spectator's eyes, providing their powers.

Stomach: Food and water created by a spectator's first eye is usually directed inward through a large passage leading directly to the stomach, where it is digested. If the spectator wishes, food can be created by that eye to feed someone else.

Skin: The skin of a spectator is thick, lumpy, rubbery, and grayish, with many blood vessels protruding from its surface. If a spectator is killed but not severely damaged, the skin can be removed and fashioned into a suit of armor by an experienced armorer. The resultant suit is in all respects the equal of leather armor and is sufficient in size to be of use to a dwarf, gnome, or the like.

Little else about these beings is known to me. I am at a loss to know how they reproduce, what they have in the way of religion (though I suspect they worship Primus or Lendor in their own fashions), or even if they have a loose culture. I never got around to discussing these matters with the few spectators I had occasion to meet. I have even heard that a breed of spectators lives in the sea, though this report is surely based upon a mistaken identification of an eye of the deep. Per-

haps someone more learned than I can fill in the details another day. . . .

Game information

When a spectator reaches 1,000 years of age, its four eyes grow very large, and its body becomes small and shriveled. After three months in this state, the spectator has only 3 + 3 HD; after six months, it has only 2 + 2 HD, and its four eyes are twice as large as they were originally. By this time, the spectator must retire permanently to a cave it has dug, since it can no longer *levitate*. Upper-class spectators serving the modrons are thrown out of the upper class at this age, but Lendor's spectators are allowed to stay in his palace until their deaths. In three more months, the spectator's body is extremely small and shriveled with 1 + 1 HD, and each of its small eyes has developed four tiny eyestalks. Finally, when a spectator reaches 1,001 years of age, nothing is left of its body. At this time, its four eyes fall off their stalks to become 1 + 1 HD spectators.

These "newborn" spectators have the power of the eye from which they came plus *levitation*. They stay in the cave in which they were born for one year, gaining an extra eye power and 1 + 1 HD every three months. The spectator with the *create food and water* ability shares the food it creates with the others. In the last three months of the spectators' stay in the birth cave, each gains the antimagical power of the large eye. When the spectators are fully developed after one year, they leave the cave to build lairs of their own. Spectators under one year of age or over 999 years of age are immune to the *monster summoning V* spell.

SEARECHTER (Marine spectator)

FREQUENCY: *Very rare*

NO. APPEARING: 1

ARMOR CLASS: *Body 6, eyes -1, eyestalks 8*

MOVE: *-20"/40"* (B in water, E in air)

HIT DICE: 6 + 6

% IN LAIR: 35%

TREASURE TYPE: *See below*

NO. OF ATTACKS: 1 *bite*

DAMAGE/ATTACK: 1-2

SPECIAL ATTACKS: *See below*

SPECIAL DEFENSES: *See below*

MAGIC RESISTANCE: 50%

INTELLIGENCE: *High to exceptional*

ALIGNMENT: *Lawful neutral*

SIZE: L (5½' diameter)

PSIONIC ABILITY: *Special*

Attack/Defense modes: *Nil/nil*

LEVEL/XP VALUE: VII/865 + 9 hp

Among a select few wizards (usually those from coastal cities or who are masters of summoning), there are rumors of a race of marine spectators dedicated to slaying eyes of the deep. In the WORLD

OF GREYHAWK® setting, these are the elven and human wizards living on the Spindrift Isles. The Suel god Lendor, believed to be an Arch-Mage by many, taught the inhabitants of the Spindrifts how to summon spectators. Spectators living in Lendor's stronghold heard these rumors of their marine cousins and passed them on to their summoners.

Although there is such a creature as the marine spectator, it is cautious and actually avoids eyes of the deep. These marine spectators are also called sea spectators, spectators of the sea, or (most commonly) searechters. They dwell in the depths of the ocean and are very rarely encountered, and then are nearly always mistaken for eyes of the deep.

If a wizard researches the means of summoning a searechter, he finds that one can be summoned by the casting of *monster summoning VII* spell, with three small eyes from an eye of the deep employed in place of three beholder's eyes. The wizard must cause the searechter to appear underwater or it will not be brought forth. Few sorcerers has ever tried this summoning because of the difficulties in obtaining the proper material components.

Searechters have six small eyes on the end of six eyestalks and one large central eye which functions as does a spectator's. Each of its small eyes has a spell-like function, explained as follows. Each power is usable three times per day and functions as if cast by an 8th-level spell-caster.

Eye no.	Spell
1	<i>Airy water</i>
2	<i>Airbolt</i> (new spell)
3	<i>Charm monster</i>
4	<i>Fear</i> (as wand)
5	<i>Water breathing</i>
6	<i>Paralyzation</i> (as wand)

In front of each of the searechter's eyes is a thin, clear shell that has a magical equivalence to + 3 metal. If the searechter is killed, this "eye crystal" can be removed and fashioned into small weapons such as dart tips and dagger blades of + 3 value. Likewise, if a strap is somehow attached to the large eye crystal, it can be used as a + 3 (and transparent) small shield. Nonetheless, it is difficult to cut and melt this material in order to fashion it into weapons or defensive items. Finding a way to do so is difficult and should be left to the discretion of the DM.

Any attack made upon a searechter has a 50% chance of hitting its body, a 25% chance of hitting its large eye, and a 25% chance of hitting one of the six small eyes on top (with, in the latter case, an 80% chance that the attack hits an eyestalk and a 20% chance that it hits one of the small eyes directly; which eye is hit is determined at random). A successful hit upon one of the small eyes blinds that eye and

Airbolt (Alteration)

Level: 3 Components: V
 Range: 1"/level CT: 3 segments
 Duration: Instant. ST: None
 AE: One target

Explanation/Description: By means of this spell, a magic-user is able to create a concentrated blast of air roughly 3" in diameter. Using only verbal components, this spell utilizes the air around it and focuses it into a powerful beam that may then be directed by the spell-caster. Although this spell works underwater (where oxygen exists in a hydrogenated form), it will not work in a vacuum. *Airbolt* may be used as an offensive weapon, a powerful version of *gust of wind*, or a modified *push* spell. Because of the spells concentrated beam, only one creature or item may be targeted per spell. Damage for this spell is 1d6 per level (or 2d6 per level underwater, due to the greater ability to concentrate the spell in this medium). A saving throw vs. spells allows the one attacked to take half damage. The spell-caster blows a puff of air as this spell is cast.

With regard to the searechter, *airbolt* has a range of 6" in water and 2" in air, and it does 6-36 hp damage in water and 3-18 hp damage in air. The *airbolt* is not as potent in the air because it diffuses, whereas the spell is enhanced by the dense medium of water. A saving throw vs. spells allows the target creature to dodge a portion of the spells blast. The bolt is guided by sight, so a blinded searechter cannot cast this spell.

ruins its power until it regenerates. Eye-stalks take 5 hp damage before being severed, but the eyestalk and the eye on the end regrow within one day. The large eye takes 5 hp damage until it is destroyed and takes two days to regenerate.

A searechter never voluntarily goes out of the water and only rarely enters waters less than 15,000' in depth. For every 1,000' closer to the surface than 15,000', the searechter takes 1 hp damage per turn; above the surface of the water, it takes 2 hp damage per round. This is a result of the expansion of the searechter's internal gases. These damage figures are given in case the searechter is somehow brought into shallow waters or to the surface. In the water, searechters are very agile; however, in the air they have less movement control because of the damage they take from being out of water and because of their increased speed.

Searechters usually live in small sea caves, but there is a 25% chance they will live in different lairs. Roll the percentile dice on the following table to determine the lair of each:

Ruins or abandoned lairs could include a ruined storm giant palace, morkoth lair,

1d100

	Lair
01-75	Small sea cave
76-85	Sunken ship
86-90	Ruins or abandoned lair
91-96	Extensive cavern
97-99	Labyrinth of vortexes to or from the plane of Elemental Water
00	Vortex leading to the water-filled caverns under Lendor's stronghold on Nirvana

triton stronghold, sea dragon lair, aboleth city, kraken lair, and many others. A vortex is a gateway leading to or from another plane. If the vortex leads to the plane of Elemental Water, there is a 50% chance that water flows into it (creating a whirlpool) and a 50% chance that water rushes out of it, filling the worlds oceans. If the vortex leads to Lendor's stronghold, it will be full of water and without current; this is the gateway by which Lendor brought searechters to this world.

There is a 75% chance that a searechter has some creatures enslaved by its *charm monster* ability. The slaves are usually humanoid in appearance, such as sahuagin. Slaves hunt for and protect the searechter. There are usually 2-12 hit dice of slaves, but usually no one creature with over 4 HD (2 HD is the average slave's level). Searechters do not usually have treasure except that of their slaves or the treasure in the sunken ship or ruins they may inhabit.

The coloration of a searechter is either dark blue or black. Its body is similar in appearance to an eye of the deep's, with three eyestalks on each side of the body and two fins on its back like the wings of a messenger monodrone.

Footnotes

¹ See DRAGON® issue #86 for more information on the Suel deity Lendor.

² The spectator attacks with only a -2 on its "to hit" rolls because of its ability to psionically sense intelligent opponents, though the spectator does not have any other psionic abilities. In this manner, the spectator gains an accurate idea of where its enemies are located. If the spectator is attacking a creature with no brain, such as a golem or a skeleton, it suffers the usual -4 penalty on "to hit" rolls.

³ When a magic-user summons a spectator, the DM should roll percentile dice to determine the class of spectator. A roll of 01-75 means a lower-class spectator appears; a roll of 76-99 means an upper-class spectator appears; and a result of 00 means the magic-user has summoned one of Lendor's favorite spectators (which has 36 hp and high intelligence). In this latter case, Lendor will eventually come to the Prime Material plane, release the spectator from its bondage, and return to Nirvana with his elite spectator, without bothering the summoner further. Ω

There's big trouble now...

And it will only get worse for everyone if the hero doesn't find those gems he just stole—now stolen right from under his nose!

Some thief!

ECOLOGY OF THE

SPELLWEAVER

Magic is the birthright of many creatures; powers in excess of most mortals' abilities that seem to grant them dominion over lesser races. Dragons, beholders, titans: these beings all manipulate the world through magical might, but none hold mastery over and refine their powers to the degree of the enigmatic and elusive spell weavers. Natural sorcerers, as potent as they are alien, spell weavers are the orphans of an ancient empire, ruined seemingly by happenstance. Collectors, traders, and instigators, spell weavers ever seek a way to reshape the present, which has perhaps gone terribly wrong.

HISTORY OF THE SPELLWEAVER

Only seen on rare occasions, and always because of their involvement in some scheme to obtain magic items by trade, persuasion, or force, spell weavers are a mysterious race of powerful sorcerers. These elusive beings evidence the last descendants of an ancient, magically advanced empire that, millennia ago, spanned numerous worlds and planes.

In this forgotten time, the spell weaver empire consisted of a vast league of colonies, called nodes, which spanned the multiverse. Huge pyramids of stone and steel powered

"Now I am my death and my decay, and soon I shall be nothing... but the scheme of my causes will repeat itself, and generate me again. I lived six times to breed six new lives, and I shall be the same, identical life. I shall be born again as six recurrences of myself."

—From the Breeding Tablet

by gigantic magical furnaces, these nodes were widely separated, often with only one existing on any single world or plane of existence. All of them, however, connected to one another through a complex matrix of magical portals. Thus, each node served as a huge planar travel installation, capable even of instantly moving with all of its inhabitants to other locations or planes.

The so-called spell weaver empire was largely a noninvasive one—an advanced community of intellectual watchers who only occasionally subjugated more primitive creatures to carry out menial chores and hard labor. What few races they encountered that posed threats the spell weavers gifted with powerful magic items and artifacts, allowing these cultures to destroy themselves from within (an act some spell weavers still practice in modern times). Yet, above all, the spell weavers

were interested in semantics, a subject they had researched for thousands of years, traveling through the multiverse to meet and observe nearly every culture imaginable. Through the tireless study and practice of innumerable symbol and language codes, the spell weavers learned to avail themselves of their physical attributes and natural talents like no other race, developing an uncanny telepathy and the ability to cast multiple spells at once.

Few know if the spell weaver plan to acquire total knowledge of all existing communication was their ultimate goal or if they had some other purpose. What is known is that, at the height of their prosperity, the spell weavers conducted a grandiose and dangerous experiment, possibly an attempt to alter reality across the entire multiverse. This experiment, however, met with tragic failure and caused a catas-

trophe of colossal proportions. For unexplained reasons, the furnaces within every spell weaver node exploded one after the other in a terrible chain reaction, obliterating the pyramidal colonies and all their inhabitants within seconds, effectively purging the multiverse of the spell weaver empire in a single moment. Only the few members of the race who were away from the nodes survived, becoming the ancestors of all modern spell weavers.

PHYSIOLOGY OF THE SPELL WEAVER

Averaging 5 feet in height and 100 pounds, spell weavers are six-armed alien-looking creatures. Their genderless bodies are smooth and hairless, varying between numerous shades of gray and occasionally splotched or speckled with light colors such as beige, pink, or yellow. Their necks are long and exceptionally nimble, allow-

ing spell weavers to turn their heads completely around with no effort. Further adding to their alien nature, spell weaver blood is metallic blue in color, similar to quicksilver.

All spell weavers carry chromatic disks, thin, 6-inch-diameter circular objects made of a silvery substance that is stronger than steel. At a spell weaver's will, the disk can change color and show a variety of patterns and designs on its dark surface. These objects are intimate creations of spell weavers, actual living extensions of their beings. In the rare case that a chromatic disk is lost or destroyed, a spell weaver can quickly replace it through meditation, exuding blood and fluids from the palm of its hands in the form of a metallic resin. The resin is manipulated to form the disk shape and solidifies quickly. This process takes only an hour but leaves the spell weaver exhausted.

Spell weavers are extremely long-lived creatures, with a lifespan near six centuries. Age does not seem to significantly affect their physical abilities, and only lighter skin tones distinguish older individuals from younger ones. Aging, however, is directly tied to reproduction for spell weavers in a complex and mysterious pair of rituals.

Upon reaching the end of its life—a time spell weavers seem to instinctually know—an elder spell weaver can rejuvenate its body through a special hibernation trance requiring the draining of a near-priceless amount of magic items. In preparation, the spell weaver sacrifices the energies within its accumulated magic treasures, destroying them to create a cylindrical “coffin.” It then finds a secure location, as the rite leaves it effectively helpless for the trance's entire duration. Upon sealing itself within the

coffin, the spell weaver enters a state of suspended animation from which it cannot be awakened. This process usually takes only a month, but sometimes lasts far longer, with evidence of spell weavers languishing within their coffins for centuries at a time. At the end of this ritual, the spell weaver is physically restored, its skin darkened and its life renewed for another six centuries. This restorative process only seems to function for spell weavers, yet even so they keep its specifics a mystery from all other races. This trance only functions six times, providing no benefit beyond that. Despite their lengthy lifespans and these renewing trances, however, spell weavers are far from immortal.

To reproduce—an act that is for spell weavers little more than a final act of self-regeneration—an elder specimen who has gone through all six rejuvenation processes may perform a complex, ritual self-sacrifice that results in the “birth” of six new adult spell weavers. The rite requires a special array of breeding vessels found only in a few rare spell weaver sites. To perform the ceremony, the parent creates six new chromatic disks and places them into the vessels where the new individuals form and grow in a few hours. During that time, the parent dies and decays, eventually disappearing into nothingness. The newborn spell weavers rise from the vessels with the full memories and mental abilities of the parent.

Spell weavers do not speak, for their law forbade speech millennia ago as part of the training to develop their telepathic faculties. They seldom emit noises, and only as a consequence. When they suffer pain, for example, they might squeal or grunt in a high-pitched tone, but nothing more. Spell weavers have their own incredibly complex language of clicks and whistles, which they know only from distant memories. In modern times, the spell weaver language is experienced only in its written form, as node hieroglyphs.

KNOWLEDGE OF THE SPELL WEAVER

The following table shows the results of a Knowledge (nature) check related to spell weavers. Those most likely to know such information are the few people who have researched the ancient spell weaver empire or have knowingly done business with them. Other sources of information might also exist near the site of a node's destruction, wastelands usually marked by a crater or rift of some sort.

As spell weavers are an extremely rare race, Knowledge checks resulting in less than DC 15 reveal no information about them. Also, considering their ancientness and magical aptitude, DMs might wish to change the skill check required to learn about spell weavers from the standard for monstrous humanoid—Knowledge (nature)—to Knowledge (arcana) or Knowledge (history).

Knowledge (nature)

DC	Result
15	Spell weavers are exotic, six-armed sorcerers who constantly search for magic items.
20	Spell weavers are silent and aloof creatures. They sometimes enslave physically powerful monsters to serve them. Spell weavers excel in magical combat and can sling many spells simultaneously.
25	Spell weavers are powerful telepaths, although they seem to shun contact with all but their own kind. Part of spell weaver communication relies on the shifting colors of their strange chromatic disks.
30	Spell weavers can rejuvenate themselves multiple times, each potentially living multiple lives. New spell weavers are spawned through a complex ritual in which an elder spell weaver dies.
35	The telepathic powers of spell weavers includes the ability to read the “memories” of certain magical objects. Their race-wide search for such items is likely tied to some greater, mysterious purpose.

PSYCHOLOGY AND SOCIETY OF THE SPELL WEAVER

Although they still comply with the dogmatic prohibition not to speak, modern spell weavers are free from the rigid social structure of their ancient empire. Sometimes a few individuals band together to pursue the common goal of acquiring magic items, but most members of the race are essentially loners.

Spell weavers have two complementary ways to communicate exclusively among themselves—a sign language that makes use of their flexible neck and six hands and a visual language based on the colors of their chromatic disks. Both of these communication methods can convey very complex and articulate

meanings, and are totally incomprehensible to other races. They are not redundant, though, for through the combination of sign language, chromatic disks, and telepathy, spell weavers can deliver hours of explanation and dialogue in a few minutes.

Spell weavers have no religion and actively shun the worship of deities, refuting these beings' divinity and mysteriously hinting at some undermining secret of their powers. Despite this disbelief, spell weavers do revere their ancestors and often meditate to better understand the will of past generations. As all spell weavers share the memories of their forebearers, this spirituality is less like actual devotion and more a kind of pious reminiscence.

During these recollections, spell weavers often recall the Time of Nodes, the golden age of their race when their pyramidal cities still existed. They refer to the catastrophe that wiped out their empire as the Disjunction, and the following age, up to the present day, as the Scrabbling. In the hopes of restoring this Time of Nodes, spell weavers seek out particular magic items or, more specifically, ancient gems imbued with "memories" that spell weavers can telepathically read. By inspecting these rare and specific gems, many spell weavers try to collect pieces of what they call the Code of Reversion, a magical formula devised before the final experiment that destroyed the spell weaver empire. The pieces of the formula were psychometrically inscribed on a series of precious stones for security reasons, and distributed in multiple copies to different keepers throughout the empire. Any spell weaver could activate the formula, but it had to read and memorize all the pieces first. The Code of Reversion essentially formed an incredibly powerful multipart spell, designed to revert time in the entire multiverse to the point when the formula was inscribed. Aware of the risks involved in their final experiment, the spell weavers devised the Code of Reversion as a chance to restore their empire if something went wrong. The catastrophe, however, exceeded their worst expectations, and the inscribed gems were scattered and lost. As such, no spell weaver has yet been able to locate and perform the Code of Reversion. Even the spell weavers are not sure if a complete copy of the formula has survived, and most gems suffer gaps in their memory that cannot be filled. Needless to say, the successful activation of the Code of Reversion would inevitably mean the erasure of thousands of years of history and the effective annihilation of all present things.

Not all spell weavers obsess over the past, however. While some accept the

The tablet illustrates the spell weaver breeding cycle.
Top Left - a spell weaver goes through his air disks (numbered with the canonic binary numerals).
Top Right - the older spell weaver produces air disks and places them into as many breeding vessels; the disks shine in the middle of the vessels, as spell weaver embryos develop overhead; the frontal position of the older spell weaver signifies "elder".
Bottom Left - the newborn spell weaver (their life cycle marked "zero") are grown to full adults.

NODE HIEROGLYPHS

The node-dwelling spell weavers of ancient times used special hieroglyphs to record the specifics of their lives, their travels, and their research. Since most spell weaver tablets date to this Time of Nodes, they are often blackened and badly damaged. The spell weavers of modern times rarely use node hieroglyphs, but can still understand them perfectly. The hieroglyphs can be read aloud with spells like *comprehend languages*, but the text is encoded in a way that its literal translation inevitably reveals nonsense to non-spell weavers. To successfully make sense of the text, a reader must succeed at a DC 25 Decipher Script check in conjunction with *comprehend languages*.

Spell weavers sometimes illustrated their tablets with simple line block drawings. The tablet presented here is the Breeding Tablet, one of the most famous spell weaver documents ever discovered. It shows the sequence of a spell weaver's six-life cycle and its final self-sacrifice.

ruin of their civilization and attempt to live peacefully, others strive to rebuild the spell weaver empire. To them, the greatest impediment to renewed spell weaver mastery is the world's infestation by innumerable humanoid races, which dominate it through their verminous fecundity alone. Harkening back to offensive strategies utilized during the Time of Nodes, these spell weavers are all too glad to supply such races with the instruments of their annihilation.

THE DISJUNCTION

No spell weaver or researcher from any other race knows what accident caused the ruin of the spell weaver empire and brought about the end of the Time of Nodes. While spell weavers acknowledge that their leaders were attempting some far-reaching magical feat, they remain universally secretive of its specifics. Two commonly held possibilities follow:

Ascension: Through their study of language, spell weavers discovered the prime form of communication, words of reality capable of manipulating all existence. Revealing that deities were little more than bickering entities with knowledge of this language, the spell weavers attempted to take their place among the powers en masse. Their intentions discovered by the existing deities, these covetous beings warped the spell weavers' attempt to elevate the population of an entire node, creating a magical backlash that rippled through and destroyed the spell weaver

NODE NUMBERS

Numbers—especially the number six—are sacred to spell weavers, and they have a senary numerical system. Spell weavers also have a decimal system, developed to cooperate with the nerra (the enigmatic rulers of the Plane of Mirrors; see page 127 of the *Fiend Folio*) at some point of their history. The purpose of this cooperation was the construction of a mirror-based, short-range teleportation device. This device consisted of several pentagonal gates that connected spell weaver nodes with selected locations in the surrounding areas. Successful transit through the gates was achieved by navigating through a maze of extradimensional rooms, using a numerical code for direction (see the *Shackled City Adventure Path* for more on this and other spell weaver artifacts).

empire, along with all knowledge of the prime language.

Unification: Spell weavers came to believe that, at the beginning of creation, all of the planes and countless worlds were in fact one single, balanced reality. This equilibrium, however, was shattered by the mercurial whims of the deities. Traveling to all of these fragmented existences and creating their nodes as anchors, the spell weavers hoped to cast a multiverse-spanning spell capable of drawing the shattered planes back together. The power of infinite infinity

LEGENDARY SPELL WEAVER ELDER

Advanced Spell Weaver of Legend Archmage 3
Medium Outsider (Augmented Monstrous Humanoid, Native)

Hit Dice: 3d4+30d8+198 (340 hp)

Initiative: +13

Speed: 30 ft.

Armor Class: 38 (+9 Dex, +10 natural, +6 armor, +2 deflection, +1 insight), touch 22, flat-footed 29

Base Attack/Grapple: +31/+34

Attack: Slam +34 melee (1d6+3)

Full Attack: 2 slams +34 melee (1d6+3)

Space/Reach: 5 ft./5 ft.

Special Attacks: Frightful presence, spell-like abilities, spells

Special Qualities: Arcane reach 30 ft., chromatic disk, darkvision 60 ft., fast healing 5, fire resistance 10, immune to mind-affecting effects, mastery of elements, mastery of shaping, reflective hide, shielded mind, spell weaving, SR32, telepathy

Saves: Fort +20, Ref +30, Will +27

Abilities: Str 17, Dex 28, Con 23, Int 22, Wis 19, Cha 32

Skills: Concentration +26, Diplomacy +23, Knowledge (arcana) +37, Knowledge (planes) +15, Listen +20, Move Silently +20, Sense Motive +20, Spellcraft +48, Spot +37, Tumble +15, Use Magic Device +44

Feats: Empower Spell, Improved Initiative (B), Maximize Spell, Quicken Spell, Skill Focus (spellcraft), Spell Focus (conjunction), Spell Focus (evocation), Still Spell

Epic Feats: Automatic Quicken Spell (0-3), Epic Spellcasting, Improved Metamagic, Multispell (x2)

Challenge Rating: 21

Treasure: Ring of protection +2, ring of minor fire resistance, dusty rose ioun stone, cloak of charisma +2, gloves of dexterity +2, amulet of health +2, wand of cure serious wounds

Alignment: Usually neutral

Frightful Presence (Ex): All creatures within 20 ft. must make a DC36 Will save or become shaken for as long as they stay within 20 ft. Creatures with 30 HD or more are immune.

Reflective Hide (Su): This monster of legend has a permanent spell turning effect.

Spell-like Abilities: Always active – see invisibility; at will – detect magic, invisibility; 1/day – plane shift. CL35.

Spells (6/999/887/767/3): As 35th-level sorcerer, DC21 + spell level +1 for evocation and conjuration spells (*). It can cast 3 epic spells per day. It can cast 3 quickened spells per round (excluding spell weaving) and all 0th-3rd level spells are automatically quickened. All metamagic spell level adjustments are reduced by 1 (min. +1).
Typical Known Spells: 0th – acid splash*, detect poison, read magic, dancing lights*, ray of frost*, ghost sound, mage hand, message, open/close; 1st – burning hands*, magic missile*, obscuring mist*, ray of enfeeblement, shield; 2nd – locate object, hideous laughter, mirror image, touch of idiocy, scorching ray*; 3rd – greater mage armor* (already cast), fireball*, fly, suggestion; 4th – locate creature, charm monster, fire shield*, greater invisibility; 5th – cone of cold*, feeble mind, teleport*, wall of force*; 6th – chain lightning*, disintegrate, greater dispel magic; 7th – finger of death, force cage*, mage's sword*; 8th – maze*, polar ray*, trap the soul*; 9th – gate*, meteor swarm*, time stop; Epic – let go of me, lord of nightmares*, ruin.

For other spell weaver abilities, see the following page. High arcana abilities are detailed in DMG.

BATTLE WEAVER

Some spell weavers train themselves to make use of an extra pair of hands in combat.

Prerequisites: Spell weaver, Str 15.

Benefit: Spell weavers with this feat gain two additional slam attacks. These additional attacks are primary attacks and have the same attack bonus as the spell weaver's other slam attacks.

Normal: Spell weavers can normally only make two slam attacks.

Special: A spell weaver can take this feat twice, allowing it to make use of all six arms in combat. This feat makes spell weavers eligible for the Multiweapon Fighting feat (see page 304 of the *Monster Manual*).

ADVANCED SPELL WEAVER

Seeking to master greater magic, most spell weavers advance as sorcerers or wizards, making the archmage or nearly any prestige class from *Complete Arcane* natural paths for many. Adhering to a strict atheism, spell weavers never advance as clerics. More martially minded spell weavers benefit greatly from the eldritch knight and spellsword (see *Complete Warrior*) prestige classes.

SCHAVRA

CR 12

Spell weaver fighter 4

N Medium monstrous humanoid

longsword, 3 +1 longswords, amulet of
natural armor +2, chromatic disk, backpack

Chromatic Disk: Schavra's chromatic disk
holds ten additional spell levels of energy.
By holding the disk in one hand the spell
weaver can cast a spell that it knows and
expend spell levels from the disk rather
than from its number of spell slots

Shielded Mind (Ex): Schavra's mind cannot be
read by any means. Those that try must
make a DC 17 Will save or be confused for
1d6 days.

Spell Weaving (Ex): Schavra can cast multiple
spells at a time as long as the sum of their
spell levels are equal to or less than the
number of hands it has free.

Telepathy (Su): In addition to the basic
effects of telepathy, Schavra can
communicate by thought with any other
spell weaver within 1,000 miles.

ties proved too great for even the bold
spell weavers, though, and their first trial
wiped their empire from the reality they
hoped to save.

SPELL WEAVER RUINS

Ravaged by the Disjunction, the ruins
of spell weaver nodes are thousands of
years old—relics of an empire lost to
time. Extraordinarily scarce, multiple
nodes rarely exist on a single world and
never on the same continent.

Every node has a similar structure,
with a main pyramid that towers more
than 500 feet tall. At the top perches a
great crystal lamp once capable of illu-
minating the surrounding landscape
with a pulsing azure light. With all prob-
ability, these lamps acted as a magical
homing beacon for other spell weaver
planar travel facilities.

Inside, the most important room
of any node was the breeding
chamber, the home of the magic
cylinders necessary for spell weav-
ers to reproduce. Only a few of
these rooms survived the Disjunc-
tion intact, and they are desperately
sought out and jealously guarded
by modern spell weavers. Secondary
to the breeding chamber was the
mortuary, a many-floored hall that
protected spell weavers undergoing
their rejuvenating stasis. Deeper
than these rooms slept the heart of
the node, a gigantic magical fur-
nace. While those in every node ever
discovered have been destroyed, an
active spell weaver furnace is capa-
ble of producing effects on par with
the powers of the deities. As such,
spell weavers throughout the planes
dream of finding a near-mythic live
node furnace.

In the FORGOTTEN REALMS, the
Tortured Lands and the Fallen Lands
both make likely spots for spell weaver
ruins. In EBERRON, a spell weaver
node might appear somewhere in the
Demon Wastes or deep within mysteri-
ous Xen'drik. The *Shackled City Adventure Path* and the adventure "The Spire
of Long Shadows," in *DUNGEON* #130,
also suggest further spell weaver plots
and designs. ■

THE ECOLOGY OF The Sphinx

by Johnathan M. Richards

illustrated by Scott Rosema

THE ROBED FIGURE approached the cave, careful where he placed his feet lest a loose pebble give him away to the great beast that dwelt inside. Even though he had never stepped foot in the vicinity before, he knew the cave like the back of his hand, courtesy of many stealthy visits experienced through the senses of a homonculus.

He stood a moment at the cave's entrance, allowing his vision to adjust to the gloom of the interior, then moved quietly inside. He could hear the soft, rhythmic sound of the creature's breathing just up ahead: good, he was asleep. That would make it all the easier.

Taking a side passage away from the beast, the wizard followed its crooked, meandering way until he was certain he was out of the creature's range of hearing. Ahead was a fork in the tunnel; he knew that if he took the left branch he would find himself in the creature's treasure hoard. He knew, also, that the beast had placed several *glyphs of warding* to protect his treasure, and while it would be child's play to move past the creature's feeble defenses, he preferred his own intricate plan. Why steal from one, when there was treasure from many to be had? The wizard seated himself against the rock wall of the cavern and began the words to his spell.

Great Andrumache snored contentedly, enjoying his midday nap. An androsphinx, he was leonine in build, save for the hawk wings folded upon his back and his bearded human face, currently resting on one cheek in gentle repose upon his front paws. He was much bigger than a lion, reaching a good eight feet tall when standing upon all fours. Like true lions, he lived in a warm climate and chose to spend the hottest part of the afternoon napping in his den.

Currently, Andrumache was enjoying a pleasant dream, reliving a glorious kill when he had swooped down from the sky onto an antelope that had been entirely unaware of his presence. As he tore pieces of flesh from the antelope's haunch, his dream took a sudden turn, changing from a re-enactment of something that had actually happened to something altogether new.

A globe of flame streaked across the sky and landed in a fiery conflagration at Andrumache's feet. The androsphinx could sense the heat of the flames, but he felt no pain. A figure took form, coalescing from the flames to become similar in shape to Andrumache himself, only larger, with wings of fire and a mane of flames circling his ancient face.

"Andrumache," the flame-sphinx belatedly, "You have yet to mate. I know your reluctance, but think upon this: by the cruel dictate of fate, there is only

one female sphinx, the gynosphinx. Yet there are three male sphinxes: the wicked hawk-headed hieracosphinx, the bestial ram-headed criosphinx, and the noble androsphinx.

"Nature decrees that whenever a gynosphinx mates with either a hawk-head or a ram-head, she will bear a male child resembling its father. It is only through the union of androsphinx and gynosphinx that either of these two sphinxes is born. Without such unions, both the androsphinx and gynosphinx would perish from the world, bringing the hieracosphinx and criosphinx to extinction soon afterward.

"The time has come for you to fulfill the duty you owe to your bloodline, Andrumache. Tomorrow, I will send a female to you. Do not disappoint me." The flame-sphinx started to fade from view.

Just as suddenly, it returned. "Oh, and I might just pop in on you myself, Andrumache. Do not look for me in this form, for I shall be wearing another."

Again, it faded from view, and the small fires that had started at its first appearance went out as well, leaving the puzzled Andrumache and his antelope alone in the silence of the dream.

The next day, the robed figure trekked through the woodlands, stopping only to wipe his forehead with a handkerchief and take a long draw from the waterskin at his belt. As he replaced the stopper, he heard a sound from just ahead. *Ah*, he thought, *right on schedule*.

Cresting a small rise, he saw a large, leonine creature pushing dirt with its front paws to cover up a hole.¹ Its features identified it as a sphinx: the lion's body, covered in tawny fur; the powerful, brown hawk-like wings, with feathers shading to a light, creamy tan at the tips. And the creature's head made perfectly clear its exact genotype: It was a criosphinx, with curling, spiral horns jutting from its curly-haired ram's head.² Somehow sensing the robed human's approach, the monstrous sphinx spun around to face him.

1. Criosphinxes live in warm, woodland regions and tend to be wanderers, disdaining permanent lairs. For this reason, they bury their

treasure in the ground, often having several caches spread over a considerable amount of land. They have a remarkable memory in terms

of keeping track of their buried loot, able to head directly to the location of a cache they buried decades before.

"Ah," said the criosphinx. It curled its lips up in a parody of a human smile, exposing numerous sharp teeth, seeming somewhat out of place in its ram's mouth.³

"Hello," began the wizard. "My name is Ulrubio—"

"All the same, I think I'll just call you 'Dinner.' It rather simplifies things, don't you agree?"

"Ah, yes, I see," said the human. "Of course. I seem to remember something about sphinxes being man-eaters. But don't you have to ask me a riddle or something first?"

"I'm sorry," replied the criosphinx. You seem to have your sphinxes mixed up. The female sphinx is interested in riddles; I, as a male, am far more interested in dinner. Which is to say, 'you.' " He took a few steps toward the wizard, padding forward in feline grace, then stopped short. "Unless, of course, you wish to purchase your safe passage?"

"By all means," replied the wizard. "How much do you want?"

"How much do you have?" asked the sphinx pleasantly, the glitter of gold shining behind his eyes.

Well, uh, actually, nothing on me at the moment, just now."

"What a pity," exclaimed the sphinx with a sarcastic sigh, and crouched down, preparing to pounce. "I'll tell you what, though, I'll give you a head start."

The wizard held up his hand to the crouching criosphinx. "Wait! A thought occurs to me!"

The creature relaxed its muscles and stood up to its full height, where it could look down at the robed figure before it. "Yes?" he asked impatiently.

"Perhaps I could direct you to a gynosphinx. Would that buy my life?"

The creature narrowed its eyes and bent its head so that it could look directly at the human. "You know where there's one to be found?"

"Yes, as it happens, I do," replied the wizard. "Only there remains one slight problem . . ."

"Yes?"

"She's been captured by another sphinx. He looks like you, only not quite so big and he has a bird's head."

"Pshaw!" exclaimed the criosphinx. "Not a problem at all!" Suddenly, a thought struck him, and he posed a question. "There's just the one of him?"⁴

"Just the one male, yes, and the one female."

Well then, you're in luck, human. Simply tell me where they can be found, and I'll be on my way."

The wizard gave the sphinx directions to an abandoned temple, half-buried in the desert sands, several hours away by air. As the sphinx stretched its wings for flight, the wizard called out a question of his own.

"How is it that you can speak the language of mankind? I thought you could talk only to others of your kind, and to animals."

"Nonsense! If that were so, how could I bargain with such as yourself?⁵ Now enough, I must be off. You may tell others that you had the unique experience of surviving an encounter with Great Rameses."⁶

As the wizard watched the criosphinx become a distant speck in the distant sky, he smiled to himself and said, "All the same, I think I'll just call you 'Dullard.' It rather simplifies things, don't you think?" Then he cast a spell and teleported away.

The wizard appeared on a hill and found himself in the presence of another sphinx. This one had the feathered head of a hawk to match his wings, and the body of a lion elsewhere. It glared at him, but made no move to attack.

"Well?" asked the wizard. "Have you thought it over?"

"Yes," replied the sphinx.

"And?"

"I agree to your terms. I will be your riding mount, and you will provide me the location of a mate and half of any treasure we earn together."

"Excellent! My name is Malrubio, whom you may address as 'Master.' " He reached inside his robe and pulled out a leather bridle.

"I will do no such thing, nor will I wear that. This is a partnership of equals."⁷

"Indeed. Well, I'll have no need of this, then, will I?" The wizard tossed the bridle on the ground. "You may call me Malrubio, then. And what shall I call you?"

"My name is Warhawk."

"Well, Warhawk, if you won't wear a bridle, perhaps I'll at least be able to talk you into wearing a set of saddlebags. They will be handy in transporting your treasure from its current location to your new home on the lands surrounding my castle estate."

"Agreed."

"Speaking of which, where is your treasure presently kept? I ask only because it might be a day or two before we can transport it, and I'd hate to see it uncovered in your absence."

The sphinx gave a quick look over to its right, to another hill where its nest was located?⁸ "It's safe enough," he responded.

2. A criosphinx is born without horns, but they develop rapidly during its first year of life and then with increasing slowness thereafter. Each year another ridge of new growth appears at the base of the horns, and it takes about 12 years before the horns start to spiral forwards. A criosphinx's horn can be used as an alternate material component for the *shout* spell.

3. While the criosphinx's head is that of a herbivorous ram, it has the appetite of a carnivore and the teeth to match. Its sharp teeth are used to rip chunks of meat from its prey (after which it swallows the pieces whole, but the criosphinx does not use its teeth in combat, preferring instead to rely upon the sharpness and swiftness of its claws and the powerful butting ability of its horned head.

4. Hieracosphinxes are the only type of sphinx which commonly band together in any numbers (they are found in groups of 1-6), preferring the "strength in numbers" strategy when attacking. Both androsphinxes and gynosphinxes prefer a solitary existence, and criosphinxes tend

to remain on their own as well (although occasionally, when searching for a mate, several of the beasts will follow each other, each hoping to take the gynosphinx as his own when, and if, she is ever found). Note that the "No. Appearing" entries in the *MONSTROUS MANUAL* have inadvertently been switched between the gynosphinx and criosphinx; gynosphinxes are encountered singly, while up to four criosphinxes can be found traveling together looking for a mate.

5. It only makes sense that a criosphinx is able to speak the Common tongue, as well as the language of sphinxes and that of the animals, for it has a higher Intelligence rating than a hieracosphinx, 20% of which can speak Common. Also, in the description in the *MONSTROUS MANUAL*™ tome mention is made of it bargaining with other beings, a difficult process were it not able to speak the Common language of the region.

6. It is a common practice for criosphinxes to add a descriptive adjective to their name: hence, Great Rameses, Bold Necrotiki, Swift Ibericus, and so on.

7. It is not unknown for a hieracosphinx to join in partnership with powerful evil beings, but while they're willing to serve as flying steeds, they dislike being treated as if they were mere horses. Furthermore, they are contemptuous of those weaker than themselves and will take advantage of any weakness they see in their "masters." They will remain loyal only as long as they fear their master's power; otherwise, the "master" is likely to end up as the hieracosphinx's next meal.

8. Perhaps because of their partial hawk heritage, hieracosphinxes prefer to lair in nests. Due to their large size, they make their nests on the ground, often at the base of a large tree, or against a large rock outcropping where they are afforded some protection from above. Hieracosphinx nests are simple structures made of broken tree branches, grass, dirt, and occasionally the bones of their prey. The nest serves no purpose other than providing the hieracosphinx with a place to sleep and an area in which to hide its treasure, which is often buried underneath the nest site or simply piled up against the walls of the nest.

"That's all I wanted to know," replied the wizard. "Shall we go?"

"Where to?"

"Why, to find you a mate, of course. I intend to live up to my part of the agreement, after all."

"That's it below," said the wizard.

"I don't see her," replied Warhawk. He circled the structure, gradually spiraling down lower, searching eagerly for any sign of the gynosphinx the wizard said lived there. *If he's lied to me, thought the sphinx, I will chew him in half.*

The temple building lay half buried by an enormous sand dune. It was impossible to judge its size based only upon the part of the structure that was visible.

"Land over there, on the side. We don't want her catching sight of you and escaping. I'll go in and get her to come out, and then you can grab her."

"Why don't I just go in and get her?"

"Because she's on her home ground in there! There's no telling how many traps she has set up, to stop amorous swains like yourself from having their way with her."

"What'd you call me?"

"Just land."

Warhawk did as he was told, and the wizard dismounted. "Now stay here, and keep your eyes open! Be ready to take action, but by all means, don't come inside the building! It's far too dangerous." And with that, the wizard walked up to the ancient structure and entered it.

Again, he was familiar with the place even though this was his first time actually inside; homonculi made excellent spies. He let his eyes adjust to the gloomy interior, then went deeper inside.

The roof of the structure was supported by massive marble pillars. The majority of the building consisted of a single huge, open room, with several smaller rooms in the back. Reclining

on the floor near the back of the room was a gynosphinx. The wizard had a hard time making out details in the dim light, but the voice was unmistakably female.

"Who is there?"

"It is only I, Bellrubios, an explorer and wanderer, a seeker of fabulous treasures."

"Alas, the treasures here have already been claimed by me. You have traveled in vain. Unless there is some service you seek from me?"

The wizard stroked his chin, as if in deep thought.

"A magical item you wish me to scrutinize for you, perhaps?" prompted the sphinx. "A curse you need removed? I assure you, I can offer reasonable rates."

"Actually," replied the wizard, "there is one thing . . ."

"Yes?"

Well, I understand you sphinxes are well-known for your wisdom. Perhaps you could tell me what ails my griffon. He seems to be pining for something, but he refuses to speak of it, and its beginning to affect his performance. Would you be willing to come outside and look him over?"

The gynosphinx's eyes narrowed in suspicion. "Your griffon speaks?" she asked.

"Indeed he does. I'd be happy to introduce you to him." The wizard stepped to the side and extended his hand toward the outer doorway of the half-buried temple.

"No need," replied the sphinx, and growled softly to herself under her breath, activating a *clairvoyance* spell.⁹ Suddenly she sprang to all fours, muscles tensed for action and eyes glaring with anger. "You fool!" she hissed. "That's no griffon—it's a hieracosphinx!"

"Really?" asked the wizard, feigning surprise. "But he swore that he was a griffon. It looks like we've both been duped! What do you think he wants?"

"Idiot! Keep your voice down! He wants me, of course. I should rip your heart out for bringing him here!"

"Really, I don't think that will be necessary. Tell you what, maybe it would be best if we just left." With that, the wizard headed for the entrance, but he stopped at the doorway and looked back into the darkness at the gynosphinx. "I don't see what the problem is, though. You're both sphinxes, aren't you?"

"He is a hieracosphinx! An abomination!"

"Well, what about a sphinx with a head like a ram?"

"They are little better than animals. I would as soon mate with a goat as with a criosphinx."¹⁰

The wizard peered out the doorway, squinting at the open skies of the desert. "Well, here comes one now," he said.

Great Rameses glided down to the desert floor, shrieking a challenge in the language of sphinxes to the hieracosphinx he found guarding the abandoned temple, just as the wizard had said.

"Vile abomination! Begone from here, lest I slit your belly with my keen horns! Flee back to the hills, and leave the gynosphinx to your better!"

"Never!" responded Warhawk. "She was promised to me, and I'll kill any who try to take her from me!" He flexed his wings and prepared to take to the air, where he knew he would have the advantage.¹¹

Great Rameses struck at Warhawk with his head, butting against the hieracosphinx's side with his horns. Warhawk twisted to the side and bit at the criosphinx's shoulder with his sharp beak. The two wrestled back and forth, trading rakes with curved claws until both were bleeding from many wounds. Still they gave no quarter and spouted vile insults at each other between grunts and howls of pain.

"Sparrow!"

"Lamb!"

"You know, I feel just terrible about this," said the wizard, watching the two males in their life-and-death struggle. "Who do you think will win?"

9. Gynosphinxes are able to cast the following spells once per day: *detect magic*, *read magic*, *read languages*, *detect invisibility*, *locate object*, *dispel magic*, *clairaudience*, *clairvoyance*, *remove curse*, *legend lore*, and are able to use each of the symbols once per week. These spells are part of the magic inherent in the gynosphinx, and require no material components or spell books. The same is true of the androsphinx, who is able to cast spells as if he were a 6th-level priest. The androsphinx prefers to use his spells for healing and defense and will almost always draw his spells from the following spheres: All, Animal, Guardian, Healing, and Protection.

10. As far as mating goes, the gynosphinx is restricted to the three types of true male sphinxes: androsphinx, criosphinx, and hieracosphinx. The so-called "dracosphinx" (see the *MONSTROUS COMPENDIUM® Annual, Volume Two*, page 104) is not a true sphinx but is named because its "winged lion" build gives it the appearance of some type of sphinx. Dracosphinxes, however, are hybrid creatures, possibly a magical merging of a red dragon and an androsphinx, but the race has two separate sexes and is mutually infertile with the true sphinxes.

Similarly, the "astrosphinx" (see *MONSTROUS COMPENDIUM 9: Spelljammer Appendix* under

"Sphinx, Astro") is not a true sphinx, either. Several clues include the fact that it's covered in scales, has human hands, and its wings are bat-like instead of feathered. Whatever being created and named these creatures had only a vague understanding of the true sphinxes' physiognomies.

11. Although the smallest of the male sphinxes, the hieracosphinx enjoys the fastest airspeed and maneuverability of any sphinx (Maneuverability Class C, or D if being used as a riding mount). Again, this is no doubt due to the creature's hawk-like nature and build.

The gynosphinx had crept up beside the wizard and watched. "In a one-on-one struggle, the criosphinx usually wins. It is larger and can inflict greater damage with its horns than the hieracosphinx can with its beak."

"Then the criosphinx will win your hand." In the light of the doorway, he got a better look at his companion. She stood a good seven feet tall, with a human face, neck, shoulders, and breasts. The rest of her body was that of a lion, with large wings sprouting from her shoulders. "Uh, I guess paw," he amended.

"Not if I can help it," she said, and moved past him out the doorway. "I can escape while they battle, and hopefully put enough distance from the winner between us for me to remain free."

"But where will you go?" asked the wizard, worry carefully placed in his voice. "Perhaps you could take shelter with Andrumache; he might offer you protection."

"Who is this Andrumache?" asked the gynosphinx suspiciously, keeping a wary eye on the progress of the battle between her two rival suitors.

"He's another sphinx that I know of. Looks kind of like you, but, of course, he's a male."

"An androsphinx?" shrieked the gynosphinx. Could it really be? Tell me where he can be found!"

The wizard gave her precise directions to Andrumache's cave, and she was off like a shot, all but ignored by the other two sphinxes fighting over her. Shaking his head, the wizard headed back into the temple. From his robes he pulled out a *portable hole*. Unfolding it, he reached inside and pulled out his homonculus. Handing the little creature the *hole*, he set him off on his tasks. "It's in the room on the left," he advised. "And mind you, watch out for the *symbols*." As the little creature fluttered off, he called back to it,

"And make sure you get everything! I don't want even a copper left behind this time!" Then he went outside to watch the progress of the battle.

Andrumache paced back and forth in his cave. He enjoyed his solitude and privacy, and he was loathe to give it up. The thought of sharing his cave with a gynosphinx for the years it would take to produce a cub¹² and raise it to maturity sent him into a state of mild panic. Still, the god in his dream was right: as an androsphinx, he had the duty¹³ to perpetuate the race. He might not like it, but those were the facts of life. Without such sacrifices, the great race of the sphinx would soon perish.

A speck in the sky grew closer, and Andrumache could see the form of a gynosphinx take shape. *Tomorrow, I will send a female to you*, the sphinx-god had said. As she came to a landing outside his cave entrance, Andrumache let out a big sigh of resignation. *Maybe the years will pass quickly*, he hoped, and led the female into his cave.

The homonculus dragged the *portable hole* up to his master. "Finished already?" the wizard asked. "All right then, in you go." The construct jumped into the *hole*, and the wizard refolded it and placed it back inside his robes.

He returned his attention to the fighting sphinxes. They were both sorely wounded, yet neither would yield. The insults had stopped, as neither had the breath to waste. The gynosphinx had predicted Warhawk's defeat, though, so maybe he should take some action. With a mental shrug, he cast a series of *magic missiles* into the criosphinx's side. As battered

as the creature already was, that was enough to finish him off, and he plopped to the ground with a wet thud. Warhawk stood panting, catching his breath.

"Let's go," said the wizard, preparing to mount his aerial steed.

"Go?" squawked Warhawk. "I'm not going anywhere but inside to claim what's mine."

"She's not there anymore! Didn't you see her fly off while you two were fighting over her?"

"What? Why didn't you stop her?" demanded Warhawk.

"How? My spells are mainly lethal. I could have killed her, perhaps, but I didn't think that was the desired result. Still, cheer up, I know where she is headed. I, uh, cast a spell of location on her. We can catch her if we hurry."

"Very well," agreed Warhawk. He bent down so the wizard could climb onto his back. "Where is she headed?" he asked as he took to the air.

"To a deserted cave network she knows about. There's only one entrance and exit, so you'll be able to trap her in there."

Warhawk found the strength to fly a little faster.

"Quiet now, or you'll ruin it!" the wizard whispered. "She's in there, on the right, probably fast asleep. Off you go, now." As the hieracosphinx raced off down the tunnel to the right, the wizard shook his homonculus out of the *portable hole* and set him to work once more. "You know the drill," he instructed, then waited for what would happen next.

It wasn't long in coming. He heard Andrumache bellow in outrage, "YOU DARE?" There was a squawk or surprise from Warhawk, and then a vicious roar that sent shivers down the wizard's spine, even as far away as he was.¹⁴ There came a shriek of terror from Warhawk and another bel-

12. Although androsphinxes don't particularly like gynosphinxes—they especially dislike that the females are smarter than they are—they are loyal to them until their offspring is grown. The union of an androsphinx and a gynosphinx results in a single cub of either sex. Regardless of the child's sex, it is raised lovingly by both parents.

On the other hand, when a gynosphinx gives birth to either a hieracosphinx or a criosphinx, the cub is immediately abandoned and left to fend for itself. A gynosphinx will not kill her own offspring, even unwanted ones, but she will do nothing to help it to survive. The father takes over the task of training the young cub to speak, fly, and hunt.

13. Duty is one thing an androsphinx takes seriously. As the guardian of the sphinx race, an

androsphinx will go out of its way to see to the safety of the other sphinx sub-races, even the hated hieracosphinxes, when they are attacked by other creatures. Hieracosphinxes certainly do not share this concern for androsphinxes and will attack an androsphinx if they have sufficient numerical superiority and it appears that they might be able to kill him. They see the androsphinx as an enemy that must be destroyed if at all possible; androsphinxes see the hieracosphinx as a misguided creature that must be led onto the path of goodness by their own example.

14. The roar of an androsphinx is terrible, but the creature must be angry in order to use it. The first roar causes all creatures within 360 yards to

save vs. wands or flee for three turns. If the androsphinx roars a second time, everyone within 200 yards must save vs. petrification or be paralyzed with fright for 1d4 rounds, and those within 30 yards of this louder roar are deafened for 2d6 rounds. Further provocation can elicit a third, even more powerful roar, forcing everyone within 240 yards to save vs. spell or lose 2d4 points of Strength for 2d4 rounds. In addition, all within 30 yards of the androsphinx during its third roar are knocked over and suffer 2d8 hp damage and must save vs. breath weapon to avoid being stunned for 2d6 rounds, unless they are over eight feet tall. Stone within 30 yards of this final roar will crack unless it saves vs. crushing blow.

low from Andrumache, this time even louder. The wizard ran for the cave's entrance. He saw the hieracosphinx dart by in a flash of feathers and take to the air. After peeking down the corridor to ensure that the androsphinx wasn't within sight, he cast a *fireball* spell at the fleeing sphinx before it moved out of range. Warhawk exploded in a puff of orange fire and flames.

There was the click of nails on stone, and the wizard acted quickly, throwing an illusion of flame around his head and creating fiery wings from his back. Andrumache came into view around the curve of the cave tunnel, saw the wizard, and came to a stop. "My lord," he said, bowing his head.

"You have done well, Andrumache," said the wizard. "Now return to your mate, and do what must be done. I am proud of you, my child."

The winged creature bowed again, and returned the way he came. The wizard let out a long breath—that had been close!

The homonculous returned soon after, dragging the *hole*. "Excellent," said the wizard. "You've got the shovel?" The spindly creature stuck its head and arm into the *hole* and pulled out a hand shovel as big as it was. "Then let's go," said the wizard, stuffing the *portable hole* back into his robe. "First you've got the criosphinx's treasure to dig up, then we'll head over to the hieracosphinx's nest and pick up what he's collected. All in all, not a bad day's work." He activated a quick spell, and the robed figure teleported away.

Andrumache and his new mate didn't notice. They had other things on their minds.

Both Johnathan M. Richards and his wife Mary enjoy studying about ancient Egypt and one day hope to see the real Sphinx in person. In the meantime, they often enjoy a good game of Senet, a board game once played by the Pharaohs, which uses throwing sticks

THE ECOLOGY OF THE STEEDER

by Johnathan M. Richards

illustrated by Phil Robb

GUNDARR CROOKNOSE walked down the twisting passageways of the Underdark, trailing behind his mentor, Mordik, and the human slave they had brought along for the menial work. The slave, a ragged man captured by the duergar months ago, carried a torch and a pile of sacks. He shuffled along, weak from hunger and the demands of his present masters.

Gundarr reached up and slapped the slave on the head absently as they walked, spurring him on to faster speeds. "Move along, slave," he grumbled, but his mind wasn't really on it. Today was the day: he'd receive a mount of his own, and begin his training as an elite *kavalrach* — a spider-rider. It was an honor bestowed upon few duergar, for steeder mounts

required an outpouring of resources over many years, and each duergar community could afford to keep only a limited number in their stables. Therefore, steeders were reserved for the toughest and most deserving of the duergar warriors, and he, Gundarr, had proven his valor as a fighter time and time again.

The trio turned a final corner, and Mordik raised his hand to signal them to stop. "There," he said to his pupil, pointing to the end of the cavern ahead of them. "We've come just in time."

Gundarr pushed the slave to one side and peered ahead, eager to spot his mount. Instead, he saw only a pile of several dozen eggs, each about a foot in diameter.¹

"What trick is this?" he snarled at his mentor. "Where is my steeder?"

"In time, Gundarr, in time. Watch, for even now she comes to greet you." As he spoke, several of the eggs pulsed, as the creatures within pushed against their tight prison walls with their legs and bit at them with their mandibles.² One egg split open, revealing the gangly newborn form within.

It was a giant spider, nearly two feet in diameter once it stretched out its eight hairy legs, each still dripping with slimy egg fluid. Orange-tan bands circled its appendages at the joints, and its eight eyes glinted glossy black in the torchlight. Otherwise, the creature's body was a dark gray, matching both the stone around it and the skin of the two duergar who watched it. It raised its first set of legs high and opened its mandibles, ready to strike.

Other eggs were breaking open. The newborn spiderlings crawled into their new environment, the black and gloomy Underdark that would be the whole of their world for their entire lives. Gundarr watched them spill forth with resentment and hostility. By all the gods of battle, he expected a fully-grown battle mount, not some tiny weakling fresh from the egg!

"We'll save the biggest three females," said Mordik. "The others go into the pot."³ Gundarr drew his sword and started for the spiders, eager to spill some blood. "Wait," Mordik cautioned, "They'll do your work for you."

As if obeying Mordik's command, one of the newly-hatched spiderlings rushed at the first-born. As if sensing the motion,⁴ the first-born spun around and met her enemy head-on. Their legs intertwined as they grappled for position, each spider trying to impale the other with its wicked fangs.⁵

1. Female steeders lay clutches of 10-40 eggs at a time, usually hidden in the backs of their burrows. The eggs are webbed together in an egg sac, which protects them from the elements and small predators. Unlike many spiders, this is the only time steeders use webbing. The female guards the egg sac until they hatch (usually about seven weeks), although sometimes the eggs are taken by the duergar and used as food.

2. Like many spiders, the steeder is born with "egg teeth," special ridges along its pedipalps (the small leglike appendages on either side of its mouth) that assist it in cutting its way through the egg. These are lost during the steeder's first molt.

3. In addition to being used as riding mounts, steeders serve as a food source for the duergar that raise them. Keeping a full-grown steeder takes time and effort, and the duergar are

careful to allow only as many steeders as they can use for mounts to survive beyond hatching stage. The others are slain and eaten.

Since female steeders grow to be larger than the males (this is true of most spider species), the duergar prefer to use females as mounts. A few males are kept alive at all times to ensure future generations—while also used as riding mounts, they are usually held back from battle. Many male steeders end up as beasts of burden, hauling carts back and forth through the streets of a duergar city. When strapped to a cart, the male steeder is unable to perform the lengthy leaps for which steeders are renowned.

4. Spiders have fine hairs growing over their legs. These hairs, called trichobothria, are each set into a pit with nerve endings on all sides. In this way, the slightest movement in the air shifts the position of the trichobothria, and the spider is

able to pinpoint the source of the movement. This specialized sense allows the spider to "see" around it in areas with little or no light, and makes sneaking up on one next to impossible unless some magical means of becoming ethereal is used. Invisible creatures cannot escape detection from a steeder (or any other spider, for that matter).

5. This is common after a hatching. It's nature's way to ensure that only the strongest and fastest steeders survive. Out of the original batch of eggs, only about half survive the initial feeding frenzy. The newborn spiders stop fighting only after there are enough dead to feed those still alive. After feeding, the survivors each go their separate ways and seek out a lair of their own, lest they be attacked by one of their siblings the next time he or she gets hungry.

As more spiders crawled out of their eggs and joined the battle, Mordik, Gundarr, and the slave watched carefully.

"All right, that one, that one, and, let's see . . . that one over there," said Mordik, pointing out the toughest fighters. Gundarr waded into the struggling spiderlings, cutting left and right with his sword, leaving a pile of bodies in his wake. Only the three singled out by his mentor were spared. The slave dragged the bodies to the side and started sorting them, obviously unnerved by the way their legs kept twitching, even after death.

The first-born had killed her opponent. Using her front pair of legs to keep the enemy at bay, she had set her four back legs firmly in place on the cavern floor and used her remaining pair to flip her foe onto its back. Then she leapt upon it. Her vicious mandibles slashed open the creature's unprotected underbelly. Blood spurted from the wound, staining the cold stone floor. The spiderling kicked feebly, and died. Only then did the first-born spin to face the two duergar and the human.

Gundarr had finished his carnage and was wiping the milky blue spider blood from his blade, a dark scowl on his face. Mordik helped to drag the dead over in a pile. The slave gingerly approached the first-born's kill, as if to take it. The creature immediately assumed the fighting stance. When the wide-eyed human made no move to back off, the steeder attacked, fangs open wide to devour this new prey. The slave screamed and backpedaled out of range.

"No, leave that one," called Mordik. "She's earned it." The slave backed away even farther, behind Gundarr, eager to be away from the living steeder. The steeder returned her attention to her prey and started feasting.⁶ Nearby, her two surviving sisters each did the same.

"You didn't say I'd be getting a newborn," grumbled Gundarr to his

mentor. "How am I to ride something that small into battle?"

"You're not ready to ride into battle, Gundarr," cautioned Mordik. "By the time you are, your steeder will be big enough, never fear. All kavalrachni begin with a newborn. You will be no different. Now grab that sack, and let's go."

Gundarr gave his mentor a murderous glance, and stooped to pick up one of the two sacks filled with the dead spiderlings. The slave toted the other on his back. Gundarr slapped him in the side of the head for good measure on his way past, but felt no better for it. His mood was as black and evil as the Underdark that had spawned him.

Later that night, the two duergar sat in a warrior's den, drinking tall mugs of ale distilled from poisonous g'shnakki mushrooms. "How long until she can be ridden?" Gundarr asked of Mordik. "I wish to begin training at once!"

"Fool, you are in training!" laughed Mordik. "For the next year, you will remain close to your new mount. You will feed her. You will take your own meals in her cavern. You will sleep in her presence. In time, she will learn not to try to eat you. The two of you will form the bond necessary if you are to work together as one unit. After a year, when she has molted twice and grown large enough to support a rider,⁷ only then will you ride your steeder."

"A year? I wish to ride now!"

"Should I find someone with more courage to make it through a year of hardship?"

Gundarr growled deep in his throat and slammed his fist down hard on the table. "I will be a kavalrach!" he snarled. "Question my courage again, and I'll rip the beating heart from your body!"

Mordik chuckled into his ale.

"What will I do here for a year?" demanded Gundarr. He and Mordik had taken Gundarr's mount to a small side cavern, sealed off from the rest of the duergar tunnels by a series of metal bars hammered into the floor and ceilings. Access was through a barred cell-door. The room inside was cramped. From the rear of the cavern, a slow but steady dripping foretold a year of cold, wet, misery.

"I have already explained. You will bond. She will learn to tolerate you. In return, you will no doubt learn to sleep lightly." Mordik chuckled to himself. "You will also have time to practice your mental disciplines, to master the meditations you have been taught in order to boost your psionic potential."

"What about food?"

"Every two weeks, the slave will be sent to feed your mount."

"Every two weeks? What about me?"

"There is a small pool of water in the back of the cell, and I believe some of the fungus in your cell is edible."

Gundarr scowled. "I do not laugh, Old One."

"Good. Kavalrachni must be a hearty lot. Surely the thought of roughing it for a year isn't souring you on the idea? If you lack the courage, I can find another to take your place . . ."

Gundarr's scowl deepened. He bared his teeth, but said nothing.

"Good. I leave you to it, then. Good luck, Gundarr. See you in a year—unless you beg for release before then." And with that, Mordik swung the door closed and latched on a thick padlock. Gundarr watched him leave, equal parts hatred and determination burning in his eyes. He ground his teeth. His hands clenched and unclenched into fists at his side, as if he could feel Mordik's throat in their iron-hard grasp. It was almost a relief when the steeder attacked him, slamming him face-first into the bars. He whirled around in time to grasp the creature's mandibles, already poised to pierce his midsection. Blood pooled

6. Steeders have no poison attack, but this does not mean that they have no venom. Like all spiders, the steeder has venom glands leading to its fangs, and while weak enough to prevent it from being used in battle, after the prey has been slain the venom is coated over the victim's body. It begins to dissolve the softer tissues of the prey, liquefying them so the soupy mixture can be sucked back up by the steeder. The process is a slow one, and steeders do not like to be interrupted during feeding.

After the victim is dissolved, all that remains are the harder structures: bones, teeth, exo-

skeletons, carapaces, and any clothing, armor, and items carried. These items might be found in a "wild" steeder's lair; those domesticated by duergar or other species tend to have such valuables taken from the lair. Treasure means nothing to a steeder in any case.

7. Steeders continue to grow throughout their lives. Like all arachnids, they have hard exoskeletons which do not grow in size. Instead, once the creature becomes too large for its exoskeleton, it molts: the exoskeleton splits down the middle and the steeder shrugs out of it like a hand

pulling out of a glove. The new layer of exoskeleton underneath is somewhat softer (the steeder drops to AC 5 for a full day immediately after molting), but hardens quickly.

Steeders molt twice a year for the first two years of life. After that, they continue to grow but at a slower rate, molting once a year for several years, then every second or third year after that. Male steeders live for about 35 years, and females occasionally reach 50, although this is rare—they are usually slain in battle before that.

in his torn palms, spilled to the floor. The pain kept him focused. He devoted the whole of his attention to wrestling the creature off him and subduing it without causing it permanent damage. His brain shifted focus: gone were thoughts of Mordik, replaced by thoughts of survival, of how best to sleep without being devoured during the next year.

Battle had always been good for Gundarr's peace of mind.

"Now watch," said Mordik to his apprentice as he slowly approached the steeder. He carried only a metal spear, which he held upright as a staff. As he neared, the creature turned to face him, keeping her eyes on him.⁸

The duergar started tapping with the butt of his spear. He set up a rhythm, repeating it over and over as he closed with the steeder. She in turn remained transfixed, allowing his approach.⁹

She had grown in the past year, molting twice as she outgrew her own outer skin. Now about four feet in diameter, it was time to begin her training as a riding mount.

Gundarr had grown as well, not in stature but in maturity. He was no longer the impatient hothead eager for the immediate gratification of his desires. The year spent in isolation had hardened him, focused him. Months of forced combat in close quarters and a limited food supply had burned off any excess fat, leaving only layers of rock-hard muscle. His gray eyes were colder, more intense. They darted all around him, constantly taking in his surroundings as if to make up for a year of the same old sights. He stood straight and proud. He was a survivor.

Spear still tapping a tattoo upon the stone floor, Mordik stepped up to the steeder, then slid over to her side. There was a crackling of mental energy as Mordik used his innate enlarge ability to increase his size. His body, armor and spear expanded equally in all directions until the steeder's body reached just above his knees. He straddled the beast, then reduced in size until he was sitting comfortably on the creature's back, on the part where the cephalothorax meets abdomen. He tapped the same rhythm on the creature's back as he sat there. "And that's how you do it," he said to his student.

"An animal friendship spell would have been much easier," said Gundarr.

"Only if you want to be dependent upon a spell each time you wish to ride a new mount. And if you have the proper materials, and the hour to cast the spell. You won't always have those luxuries in the heat of battle. No, it's best to get them used to being ridden without spells. Train them once, and they're yours for life. Now you try it."

Mordik dismounted and passed the spear to his student. If he was going to learn to ride his steeder, this was the first step. Gundarr took the spear and started pounding it on the ground.

"Not too hard or too fast," cautioned Mordik. "You must get it just right, if you want her to remain still while you mount. Break the rhythm, and she'll turn on you as you approach, no matter how well you've bonded. Slow down. That's it."

Gundarr slowed the tempo and made it successfully to the steeder's side. He enlarged, climbed on, then grinned with pride. "Got it!" he said, reducing back to his normal size.

"Tap!" shouted Mordik. "Don't forget to tap!" It was too late. Gundarr

had ceased tapping and the steeder was no longer receptive to advances. Unable to reach its own back with its mandibles or any of its legs—it leapt.¹⁰

The creature landed on the cavern ceiling. Gundarr was not so lucky. He fell off the beast in midair, landing hard on his side and rolling over a few times before coming to a stop. The spear went clattering down the corridor.

"It's a good thing she was fed last week,"¹¹ said Mordik, shaking his head sadly, "or you'd be spider food right about now." Gundarr groaned and looked up at the steeder on the ceiling, front legs raised straight out in the defensive stance as if concerned that the young duergar would somehow follow her up to the ceiling and attack. Her body touched the cavern ceiling, her six other legs bent well beneath her, ready to spring her forward into pitched battle. Her deadly mandibles were spread wide open, ready to deal maximum damage to any who would oppose her. Her hair stood on end, eagerly sensing any motion her glistening black eyes might fail to detect. The steeder was otherwise motionless.

"Fetch the spear. We are done today," suggested Mordik. Gundarr sighed, dusted himself off, and complied with his instructors command. The steeder remained on the ceiling, observing them both.

"The day has come for the creature's first saddle," Mordik informed his student. Their human slave stood hunched over under the weight of an elaborate leather construction. Numerous straps hung down from all directions. "Saddles are an important part of a kavalrach's equipment," Mordik continued. "Without them, the

8. Steeders have eight eyes. Two of them are rather large and face forward. The other six are arranged in a semi-circle, three on either side, around the top of the steeder's cephalothorax. These simpler eyes are only used to detect movement, whereas the larger two provide eyesight equivalent to that of a dwarf (including 60' infravision).

9. The rhythmic beating plays a part in the steeders' courtship rituals. The male beats on the ground with his pedipalps, declaring his interest in the female. As he approaches, he shifts the object of his tapping from the ground to the female's carapace, then interlocks his front legs with hers, rears up, and hooks his legs over her fangs. Once she's in position, he transfers sperm from his pedipalps (placed there earlier, well before the courtship dance began) to a seminal receptacle in an epigastric furrow underneath the female's

midsection. That done, the male scrambles to safety, since he's performed his function and is now expendable, at least in the eyes of the female.

The duergar take advantage of the preprogrammed courtship rhythm, known instinctively to all steeders, to allow them to get close enough to mount one. Of course, this only works on the females.

10. Steeders combine the attributes of several types of spiders. While being predominantly a giant version of the tarantula, they differ from that species in their leaping ability. Steeders can leap up to 240 feet in any direction from a standing start, once every three rounds, even while mounted. This, plus their ability to stick to any surface if even one of their eight feet is touching it, allows them to escape from nearly any deadly situation. Steeders move at half-speed when walking along walls or ceilings.

Duergar take advantage of these abilities by constructing elaborate saddles for their mounts which enable them to remain seated even while the steeder is bounding through the air or walking upside-down along a cavern ceiling. The saddles are equipped with numerous straps keeping the rider in place; once strapped in (a process which takes 2-4 minutes, depending upon the experience of the rider), it is virtually impossible to dislodge the duergar from his steeder. The saddles do have a "quick-release" system, allowing the duergar to dismount relatively quickly (in one round) if the need arises.

11. Like most spiders, a steeder can go for weeks or even months between meals. Due to the liquefied nature of their food, they can go for up to a year without water. Duergars feed captured slaves to their steeders every two weeks or so.

steeders are as dangerous to us as they are to our enemies."

"I remember well," replied Gundarr, thinking back to when he had been first thrown three years ago.

"These saddles are expensive and difficult to make. Only the larger steeders, those big enough to ride into battle, wear one. No need to waste time and resources on a smaller saddle when the creature won't last long in battle. Plus, she'd soon grow out of it when she molted. Now give it here, slave." The human complied quickly. Although a foot and a half shorter than the slave, Mordik held the heavy saddle without effort.

Gundarr knew that there would be no trouble saddling the steeder. She had spent the last four years in the company of the two duergar and their human slave and no longer considered them a threat.¹² Under Mordik's instruction, Gundarr plopped the saddle upon her back, then crawled underneath to tighten all of the fastenings. "From this day forward, she'll wear the saddle every hour of every day," said Mordik. "It will be a second skin to her. It won't be removed until she molts—and then she'll be fitted with a saddle one size larger."¹³

When it was in place, Gundarr approached and mounted easily. He no longer used the rhythmic pounding trick to approach the creature—she had long ago accepted him. They were a team now, rider and steed. Now that she was saddled, their training would continue, advancing to the next stage.

Mordik showed Gundarr how to strap himself in, and demonstrated the quick-release function. "Tomorrow, your real training begins," he said with a smile.

Gundarr rode his steeder into the battle arena and faced Mordik, mounted on a much larger beast. Each had a metal prod in his hand,

with a leather cord wrapped around his wrist to prevent it from being dropped and lost.¹⁴

"What about weapons?" asked Gundarr, eager for battle training.

"Weapons come later," replied Mordik. "We start with controlling the steeder's movements. In battle, this must become fluid. You must direct your steeder without conscious thought. We'll spend the next few months practicing control, so put away thoughts of weapons training until then. No, don't give me that look."

"Now then, hold your prod in your off hand, freeing your weapon hand. We'll begin with the basics. To move your steeder forward, use your prod here. To turn, a quick jab here, on the side. That's right, like that . . ."

Gundarr led the half-dozen goblin slaves into the battle arena and locked the gate behind him. "Go to the far side of the cavern," he commanded. "There you will find a chest. Open it."

Warily, the goblins did as commanded. Once they were halfway across the cavern, he signaled to his steeder, and she approached him, allowing him to mount.¹⁵ Gundarr secured himself into the saddle, feeding the leather straps through the metal rings attached to his drab plate mail armor specifically for that purpose.

"There are weapons inside the chest," continued Gundarr. "Arm yourselves. I offer you your freedom today, slaves!"

The goblins looked up, astonished at what they were hearing.

"The key to the gate is on my belt," said Gundarr. "To earn your freedom, you need only kill me and take the key from my lifeless body." He smiled evilly.

Across the cavern, the blood rushed from the goblins' faces. As the mounted duergar sped across the cavern floor, they hurriedly snatched up weapons and tried to organize a hasty defense.

It did little good. Control prod in his left hand, Gundarr sent his steeder straight into the center of the mass of goblins, sword cutting a bloody swath through them. Two swipes of his blade brought down as many goblin slaves. After passing through them, he prompted his mount to leap to the ceiling, in part to protect him from goblin retaliation, but mostly to practice the maneuver. The remaining goblins ran in different directions. It was pointless, though, for the locked gate was the only way out of the arena. From his vantage point looking down, Gundarr smiled a wicked smile. *Now this was training!* he thought.

Gundarr was ecstatic. The thrill of battle was upon him. He sent his steeder speeding along the cavern ceiling, above the pool of water. Gundarr knew a slip on his mount's part would plunge them both into the water—which could easily mean his mount's death¹⁶—but he had complete faith in her abilities. Three more kavalrachni followed him, mounted on their own steeders—his strike team. He had made it to a position of command within the elite spider-riders, and gloried in the prestige and honor it brought to his name. No longer was he Gundarr Crooknose: now he was Gundarr Kavalrach, Strike Team Leader!

They passed the underground pool, rounded a corner, and found their prey: a group of svirfneblin returning home from their patrol. One of the lead/members looked up at the last minute, perhaps catching a glimpse of movement, but it was far too late. Gundarr's steeder was already in flight, landing on the lead svirfneblin and biting down with her fangs. The little svirfneblin tried to squirm free, but she had him in her first pair of legs, from which there was no easy escape.¹⁷

The other steeders in Gundarr's strike team dropped down from the

12. Steeders in the wild are solitary creatures and do not form lasting relationships with other beings, not even their mating partners. (More times than not, the female will attempt to devour the male immediately after mating.) The female will guard her egg sac until the newborns hatch, but from that point on, they're on their own. A rider/mount "partnership" must develop slowly over the course of many years.

13. This, of course, is the simplest way to determine if an encountered steeder is wild or domesticated—domesticated ones will always be

saddled if they are large enough for battle training. The exceptions to this rule are the males, but they are usually kept confined to prevent their escape and/or death at the hands of one of the Underdark's many dangers.

14. In a pinch, these control prods can be used as a weapon, causing damage as a club. All duergar spider-riders are considered proficient in their use—this is, in effect, a bonus weapon proficiency.

15. Steeders are intelligent creatures, and those that go through the years of training that kaval-

rachni and their mounts do can be taught to recognize several hand signals. These usually consist of the following commands: come here, remain where you are, attack that enemy, fetch that object.

16. Steeders breathe through holes in the sides of their abdomens, so they will never willingly enter water, as it is much easier for a steeder to drown than a humanoid—it doesn't do a spider any good to hold its head above water, and it is unable to close off its air-intake holes. A steeder immersed in water drowns in 1d3 rounds.

cavern ceiling and attacked as well. The disorganized svirfneblin had little time to react before being overpowered. Some broke ranks and tried to flee, but ran straight into Mordik and his own band of kavalrachni, who had approached the svirfneblin party from the other direction. With nowhere to turn, they did their best to make a stand, but between the steeders' wicked fangs and the duergars' equally wicked blades, they didn't last long.

The blood of the Deep Gnomes splattered on his battle armor, Gundarr gave a throaty roar and voiced his pleasure. "Useless gnomes!" he cried. "Worthy only as food for our mounts! Let's see if the pitiful weaklings had anything of value." He dismounted and began looting the nearest corpse, looking for the gems he knew the Deep Gnomes often carried. The other duergar followed suit. Gundarr's steeder, meanwhile, chose a svirfneblin corpse and began to feed.

This wasn't supposed to happen! thought Gundarr as his sword swung left and right, cutting a swath among his enemies. For years, his band of duergar kavalrachni had preyed upon the nearby races of the Underdark with virtual impunity. None could stand against the steeders and their duergar masters. Until now, that was.

None of the duergar had expected an attack from a bunch of svirfneblin, especially since they had been historically more interested in mining than in combat. The attack and sheer numbers of the invading svirfneblin force had taken the duergar community by surprise, and the earth elementals summoned to aid the Deep Gnomes certainly didn't help the duergars any.

Mordik had led the kavalrachni to their mounts at the first sounds of battle, and they flanked the enemy. The strategy worked well, for the steeders were able to maneuver on the ceilings out of the range of the svirfneblin warriors' weapons and position themselves to best advantage before striking. Gundarr's steeder had killed six of the deep gnomes before the sheer number of them swarmed over her; he had been forced to jettison himself from the steeder's saddle and fight his way back to safety. His sword was slick with the blood of his enemies, and his muscles ached from the hours of endless combat, but at long last it seemed that the enemy had been driven back. The svirfneblin attack had done great damage to the duergar community, but not as much as they had hoped, and they were forced to retreat.

Gundarr looked over the battlefield, picking his way past dead duergar and svirfneblin both until he found what he was looking for. There she lay, his first steeder, legs still twitching in death, pierced a dozen times over by the Deep Gnomes' sharp picks.

"You served me well in life," Gundarr said to his faithful steeder. "Now, in death, you shall serve me one last time."

She was delicious.¹⁸

Johnathan M. Richards admits that he isn't really that big a fan of spiders, although he does have nearly twenty years' worth of Spider-Man comic book lovingly stashed away in his library closet.

17. A steeder's first attack in combat is with its front legs; if successful (requiring an attack against AC 10, adjusted for magic and Dexterity only), the sticky pads on the steeder's feet prevent the prey from escaping. A victim can escape by making a Dexterity or Strength check at -10. One attempt can be made each round, but the steeder receives an automatic bite attack for 1-8 hp damage each round the victim is held. While held, the victim is at -2 to attack and damage rolls.

Due to special hairs on the steeder's pedipalps and feet, the creature is able to taste what it touches. Once a steeder has tasted something good in its forelegs, it usually won't let go until it has killed its victim.

18. A few final words about the steeder: the creature is listed in both the *MONSTROUS MANUAL*™ book (under "Spider," on pages 326-327) and in the *MONSTROUS COMPENDIUM Volume Two* (under "Dwarf, Duergar"). A quick perusal of these works

will show a number of differences in the steeder's statistics. No doubt this is a result of trying to generalize the listings for the giant water spider, flying spider, giant trap door spider, and steeder into one listing in the *MONSTROUS MANUAL* book. While this saves space and allows a greater variety of monsters to be included in its pages, it doesn't accurately reflect the steeder's statistics as shown in the earlier work. For those interested in the comparison, here are the differences between the steeder's statistics:

	MC2	MM
INTELLIGENCE:	Non- (0)	Low (5-7)
TREASURE:	Nil	C
ALIGNMENT:	Neutral	Chaotic evil
NO. APPEARING:	2-20	1-8
MOVEMENT:	12	3, Web 12
HIT DICE:	4	4+4
THACO:	17	15
SIZE:	M (4' high, 8' long)	L (8'-12' diameter)

MORALE:	11	13
XP VALUE:	120	975

The steeder works well no matter which set of statistics are used, although "purists" should note that the ones from *MONSTROUS COMPENDIUM Volume 2* are probably more "accurate." The Intelligence rating of "Low (5-7)" should be used, however, as steeders are intelligent enough to serve as riding mounts, a fact agreed upon in both works. Also, if using the statistics from the *MONSTROUS MANUAL* book, disregard the movement rate. Steeders cannot move in webs and have a movement rate of 12; this is mentioned in the description of steeders on page 327.

Body parts from steeders can be used in the creation of *slippers of spider climbing* and *boots of striding and springing*. They are not used in creating *cloaks of arachnidia* because of the steeder's lack of a dangerous venom and its inability to travel over or to produce webs.

Bloodthirsty

It should have been a time of celebration for the settlers of Albanner. The warm, moist breezes of spring swept away the lingering cold of winter. The houses and cabins of Albanner now stood open, embracing the new spring. Rows of corn and chew-leaf had been planted, and they thirstily drank the sunny rays of Father Tirador. It should have been a time of joy, not of mourning.

So Jenner of Northreich reflected as he looked down upon the settlement. Those brave farmers, induced by a forbearance of the Kings tax, had left the lands of the North Realm, which slept nearly eight months beneath the bitter snows of Northor, Heart of Winter. The longer growing season of the south drew first the farmers, and then the shepherds, who would buy less fodder for their flocks. Jenner, a soldier from the King's own garrison in Northreich, had been sent here to protect them. And he did—or had.

They had lived through the winter, had endured the floods brought by the melting snows, and had driven away the great herds of frost-tail deer that threatened their precious corn and profitable chew-leaf. Jenner and his handful of men-at-arms, carrying steel and the Kings Writ, now faced a more horrible, unseen enemy, one who fed not on crops but on shepherds.

With a sigh, Jenner resumed his climb up and away from the village, into the grassy hills where the shepherds watched over their flocks. He met Legrin just above the village. Legrin was an old Northman, worn by the winds of time but yet unbroken. He chewed a large wad of the leaf grown in the village below and spat it over his left shoulder upon taking Jenner's hand.

"Dal kahr," Jenner said, offering the traditional Realmic greeting.

Legrin nodded and spat again. "There are many dead now, Realmsman," was his only reply.

Jenner nodded grimly.

The first was the boy, Heb. Found him with a few of his flock—entirely drained of blood. They had puncture wounds, like an awl would make? Legrin removed a new wad of the slick,

THE ECOLOGGY OF *the Stirge*

by Tim Richardson

illustrated by Tom Baxa

green leaf, put it in his mouth, and chewed thoughtfully for a moment. Motioning for Jenner to follow, the Northman walked as he related the terrible story.

"We lost sixteen sheep—all drained o' blood with them queer wounds. There's them that say its the vampire, but I never heard of one that drank from one great tooth, or one that et sheep's blood neither." Jenner nodded his agreement. "It's no vampire. And it doesn't sound like anything I've ever heard of-or seen."

"Three nights ago," Legrin continued, "we found seven bodies—the whole Tallman family from old Gebrik to little Saysha. She hadn't even seen her second summer yet.

"Curious thing was that none o' their sheep was touched.² That's how Enlieg found 'em—their whole flock jest up and wandered into his pastures. And they was livin' quite a pace from where we first found Heb." The Northman gestured with his head, indicating a rocky crest rising above the other hills. Jenner immediately recognized its strategic value: high ground, easily defensible. To a shepherd, though, it was just a place to watch over the flocks.

"They call it 'Heb's Crown' now," Legrin said quietly. "We got excited then, seven of our own done in like that, and

we was ..." the old man swallowed a bit of the leaf, and his tale was momentarily halted by a throat-tearing cough. After a moment, he continued, "... wonderin' what to do an' all, when Val, one of the boys, came back, bloody as the day he was born."

Two young men, Val and Nured, had taken it upon themselves to explore Heb's Crown, hoping to find some clue that would explain the death of their friend. Only one still lived who could tell of their gruesome discovery.

Jenner clung to the vague hope that Legrin's description of the wounds was an exaggeration, but he had grown to learn that Northmen were incapable of hyperbole. It was an accurate, if not understated, account of the true events.

It was near sunset when the pair reached Commonfield, a large and relatively flat plain northeast of Albanner. Ten large, make-shift shelters housed the two or threescore shepherds. Nearly three hundred sheep milled about, creating an odor impossible to describe, and only slight less easy to tolerate.³ "Well," remarked Legrin unnecessarily, "here we are."

The pair picked their way down onto the plain, and Jenner risked a look back toward the rock formation that overlooked the other pasture. It was about half a day's walk from Commonfield,

1. The wounds left by a stirge are very distinctive, anyone who has encountered them before will not fail to recognize them again.

2. Stirges prefer the richer blood of omnivores,

especially humans and demi-humans. Their typical prey is a herd or flock of herbivores—like sheep or deer—but they will quickly change their feeding habits to accommodate their preferred prey.

3. Stirges have an acute sense of smell that allows them to locate and track herds of their prey—like sheep or deer. Their superior eyesight and infravision also assist them in hunting their prey.

probably not much faster on a horse because of the rougher terrain above the plain. The men of the camp were standing around watching the women load more wood into a pile that, when the sun set in the west, would burn brightly long into the night. They watched Jenner carefully as he approached, their stern faces grim and protective. Their weapons were those of shepherds: wooden cudgels and stout clubs. Jenner doubted that there was any blade larger than a knife in all of Albanner.

"Dal kahr," Jenner said, offering the first of the men his hand. The Northmen muttered among themselves, and some spat wads of chew-leaf over their left shoulders. None took the offered hand. Perhaps, Jenner mused, that was how Northmen said hello. He chose to act as if he believed it.

"My friends, I am here to help you. Good Legrin has been kind enough to explain the trouble you face, and I give you my word as the Kings man that I will make it so that none of you, nor your families, need fear any more." All in all, Jenner was rather impressed by the confidence he displayed.

The men looked hopeful for a moment and shuffled their feet. "Don't stand around like ninny-goats!" admonished Legrin sternly. "It'll be dark soon, so see to your folk!" They dispersed quickly, moving with the confidence of men who knew that something was being done to protect them against the terrors of the night. One Northman stepped forward, nodded shortly to Legrin, and spoke in a deep, rich voice. "I am called Gillum. My boy Val is the one who saw the demons."

"What!" exclaimed Legrin and Jenner almost at once.

Gillum nodded once and spat over his shoulder, a curious custom whose meaning Jenner was becoming impatient to learn. "My boy, Val, said that the things were demons. Had faces like swords, with huge glittering eyes. Little ones, with wings, they hung upside down in caves like bats, but they gots two pairs o' talons. He's got the marks on his back to prove it. He said there's more'n a thousand of 'em livin' beneath Heb's Crown."

"Gillum, yer mouth is runnin' far today. You know there ain't no demons, and they're sure ain't no thousand of 'em. Why, they'd have killed us all by now."

"That's what my boy says, Legrin. And I'll not have you callin' him a liar." Gillum bristled at the older man's rebuke.

"Gentlemen," interrupted Jenner, "let's fight against the things, not over them."

The Northmen regarded the Realmic soldier for a moment as their mouths worked away at the chew-leaf. "He's right. Gillum, accept muh apologies." The two men spat in their hands and shook on it. Jenner barely repressed a shudder of revulsion. "I'm thinkin' that you'll want to talk to the boy," added Legrin.

"Yes, I think that would be wise," replied Jenner, moving to follow Gillum to the center row of tents. The large tent was made of wool, a plentiful commodity among the Northmen of Albanner. Treated with protective oils, the roof was rendered practically waterproof, and the thicker woolen walls retained heat during the winter. An old woman, bent with age, was applying a poultice to a young man stripped to his small-clothes lying on a make-shift bed. The "boy" was larger and more muscular than his father—a tall young man who showed the promise of a warrior. He was pale and his breathing quick and shallow.

"Val," spoke Jenner softly. "My name is Jenner of Northreich. I am one of the Kings men. Do you remember me?" The boy nodded weakly. "That's good. Your father and old Legrin tell me that you are a very brave young man—that you went into the cavern under Heb's Crown to find out what has been attacking your flocks." Val nodded again, wincing at the pain of recollection. "Tell me what you saw, Val."

The boy opened his eyes, which, despite his grievous wounds, were bright and alert. The entrance to the caves below the Crown was low, sir. It ran straight, though. Me an' Nured was wadin' ankle-deep in guano—I thought it was bats at first, and said as much to Nured. Still, though, by the light of the torches it looked awfully red—and it was goopier, more like mud.⁴

"I think it was pools of blood, drippin' from their fang, sir." This quiet assertion

startled Jenner visibly, earning him a stern glance from the old lady. "Well, sir, the demons was hung from the ceiling, like bats. Only they wasn't bats. They had one long tooth, long as a dirk. Their eyes was big and round, like a bugs'. They had four talons, small, but real sharp. Them's what they use to hang on to you whiles they drain the blood right out. They got wings, too—feather ones, though, not like a bats. That's how I knowed they weren't none."

Jenner calmly examined the boy's wound. The claw marks were on the boys' back, indicating that the creatures were small. It was the "stab" wound that was the worst; it was several inches deep and did indeed look like it had been made by an awl or poniard. The wounds and the boys story confirmed Jenner's fear—he was dealing with something completely unknown to him and the Northmen.

The boy spoke again, "A few of the things flew at us right away and got me. Nured splattered one with his club and almost knocked my head clean off. That's when we started to run—but Nured fell and half a dozen of the things was on 'im before I could turn around.5 Two more stuck on me, one on my thigh, and this 'un here." He indicated the wound Jenner had examined. "Well, sir, my father says I did right by leavin' Nured . . ."

"You did, Val," Jenner said, before even the father could rumble his assent. In the corner of his eye, he saw the old woman smile her approval. "You needed to tell what you had discovered—don't blame yourself for Nured's death. You may have saved the life of everyone here."

"That's what my father said . . ."

"Just tell me what else happened, Val. Everything you can remember."

Well, sir, it was late afternoon, and the sun was still out. I managed to tear the one thing off my leg and ran as fast as I could until I collapsed." Jenner marvelled at the boy, as he noticed the chunks of flesh and muscle missing from his thigh—the boy had indeed torn it away with considerable strength. "I yanked its sticker out, but I couldn't pull it off my shoulder. I jest fell down on top of it, holdin' its sticker—it was soft, and I couldn't break it—so I held it away from

4. Stirges move around a great deal in following their prey, but often return to the same roosting sites year after year, where they may remain for as long as a season. Though not migratory, they will follow the migratory patterns of their primary prey. Common stirges defecate in their roosting areas, and, as Val noted, their guano is blood-red and tends to be more liquid than solid. The protein-rich

guano, over time, hardens into a clay-like substance that, if broken or granulated, makes excellent fertilizer for crops.

5. A stirge colony can communicate simple ideas—like danger and where to find food and mates—through movement and a series of chirps. Stirges can and will alert the rest of the colony to danger and potential food. Often, as was the case

with Nured, several will attack one target. Stirges do not attempt to assist each other like a wolf pack in any coordinated way, but their superior sense of smell allows them to recognize the smell of wounded prey. The smell of blood and fear draws the monsters to attack. Once the stirge has attached to their prey they ignore everything but a direct attack until they have drunk their fill.

me. Eventually it let go and flew off, back into the cave.⁶

"I don't know what they are, sir, but I sure hope you can do somethin' about 'em."

"Don't you worry, Val," Jenner said, standing and grasping the boy's hand. "With what you have told me, we can take care of these things once and for all. You have done a great service for us all, Val, and I shall see you rewarded. You are a good Kings man. It would not surprise me if one day you were to wear steel." Val smiled and returned the grip as well as he was able before the soldier left, followed by Gillum and Legrin.

Outside, Gillum spoke. "You did my son a great honor, Realmsman. Thank you."

"I spoke the truth, Gillum." Jenner considered the problem and made a quick decision. "I will stay tonight with you and your flocks. Tomorrow I will return to the village for the rest of my men, and we will either seal the cave or destroy these things. In the meantime, I would like to examine the sheep that were killed by these creatures."

The dry husks of the livestock had many wounds, all of which matched those of the boy Val. The blood had been drained completely. Jenner was glad that the bodies of the Tallmans had already been cremated; even his own military objectivity was shaken by the off-handed way Legrin mentioned how quickly the bodies had burned—"jest like dry kindlin'."

The night passed without incident.⁷ Jenner was pleased to see that Gillum had spread the news of his words to Val. The Northmen were a very patriotic people who revered their King. His remark that someday Val would wear steel was an honor to all of them.

Jenner left Commonfield shortly after dawn, arriving in Albanner just after midday. No sooner had the Realmsman arrived than he was accosted by Roveer d'Alindanzar, an Alian merchant who had underwritten much of the cost of the new settlement. Alians, hailing from the great jungles far to the southwest

were preeminent merchants of the lands, known as much for their financial acumen as their untrustworthiness. Roveer, like most Alians, was a small, thin man whose dark hair and copper skin made him stand out among the tall, fair-haired men of the North Realm. His eyes were bright, almost feral, and his face seemed to wear a mask that was always smiling. "Well, Jenner? What foul beast is plaguing the imaginations of our shepherds this week?"

"Roveer, I haven't the time to fence words with you today. They, we, have a serious problem. Some kind of bat that drains the blood of its prey."

The Alian looked skeptical. "Come now, Jenner! Surely the crags of Albanner are not infested by vampire bats?"

"I doubt it—unless there's a variety with only a single fang as long as a dirk."

Suddenly Roveer was all business, "What do you mean?"

Jenner, suppressing his irritation, briefly explained the boy's story and his own examination of the carcasses. "I can only guess what kind of monsters these are, but they've got to be destroyed if Albanner is going to make it. These things are killing our people."

"Indeed, they are, Jenner. Indeed they are." The little man looked thoughtful and continued, "I believe these things are spear-beak⁸—you would call them stirges in this part of the world."

"Stirges?"

"Yes, yes," said Roveer with a sigh of exasperation. "They're some bizarre hybrid of bird and insect.⁹ A large mosquito with feathers, if you will. In the jungles of Ali they grow to be quite large, and I understand they may be poisonous—a toxin that deadens the nerves, like a leech.¹⁰ In the deserts, I hear there exists a wingless variety with six legs—more like an insect than a bird, really. It hops after its prey, you see.¹¹ In any case, they drink until they're full of blood, then sleep for a few days until they're hungry again."

The Alian now had Jenner's full and undivided attention. "The ones you describe seem quite small, compared to the Alian spear-beaks, but I imagine

they are the same in most other respects." The little man looked seriously at Jenner, "You'll have to kill them, you know. It could be quite dangerous to my investment here."

Resisting an urge to slap the man, Jenner growled, "I had reached a similar conclusion. My men and I are going to the cave tonight."

With a moments pause, Roveer shook his head, "No, Jenner. I can't permit it. You wouldn't reach the cave until after sunset, and the spear-beaks are most active at night. They live in colonies, you see, which may contain several scores of the beasts. During the day, they are more sluggish, and you and your steel-encased compatriots should find them easy work. Make sure you put on as much steel as possible; the little monsters have a talent for finding the chinks in your armor. They can sense heat, and their eyes are very large, like an insects, giving them keen sight, even in total darkness."

"You will not permit —"

"Oh, settle down, Realmsman. You know as well as I do that I'm making sense. You'll need to brief your men, pack up some supplies, and go traipsing off across the high plains to get to the . . . Crown, you said?" Jenner sputtered something incomprehensible. "I think I'll go along, too. Now, don't object, my friend. It is my duty to all of Albanner."

Jenner couldn't seem to speak, but just stood, quivering in astonishment.

"Shouldn't you notify the villagers here?" prompted Roveer. "I can only assume the shepherds are taking precautions, but it would be a grave disservice if the spear-beaks were to attack here tonight instead of the flocks. I guess we should have paid more attention to the deer herds."

"What?"

The deer, Jenner, the deer. The spear-beaks range for up to a full mile, and they must have been feeding on the frost-tails. You do recall those carcasses we found that were freshly killed, but all dried out? And no meat missing—just the blood! We really should have noted that

6. Stirges need not always be killed to be removed. At the DM's discretion, he may allow a Strength check or appropriate saving throw to rip the creature from his body (causing damage) or, with successive Strength checks or saving throws, to pull the stirge's penetrating proboscis from his flesh. Make a normal Morale check when this occurs, if the stirge fails, it drops off and seeks a new victim. Note that the victim should not be able to attack with a weapon while holding back a stirge. This struggle will prove to be more exciting than your average hack-and-slash session, particularly for low-level or green adventurers.

Stirges, except in the cases above, check for Morale as a group, which is higher (10) than the individual Morale listed in the *MONSTROUS MANUAL* tome, as long as half the colony is still alive.

7. Stirges will sleep off the effects of their feeding as per the guidelines in the *MONSTROUS MANUAL* tome.

8. Stirges in various campaign worlds have many different names and the DM is encouraged to invent his own for the campaign. "Spear-beaks," "blood-birds," and "devil-birds" are common names for the stirge.

9. Stirges are a queer hybrid of bird and insect. It is believed by sages who study fantastical

creatures that they were originally crafted by vampiric wizards to throw hunters of the undead off the track. Others surmised that they were created long ago by a group of evil wizards, who gathered them by the millions, like locusts, and set the monsters on the enemy armies arrayed against them. The remnants of these stirges adapted themselves to the wild and spread across the lands.

10. The larger jungle variety of stirge does possess such a toxin, as is alluded to in the *MONSTROUS MANUAL, VOLUME 1*. The statistics for this creature appear on page 46.

11. The desert stirge is described on page 45.

earlier, but there were always so many other pressing concerns. The frost-tails were supporting the entire colony."

"Well, of course!" Jenner spat. Quickly he regained control of himself, and, at the same time, cursed the unwholesomely clever Alian. "All right, Roveer, we'll do it your way. I'll send a runner to let the shepherds know what we intend to do, until then, keep out of the way."

Roveer smiled, "Of course, my dear friend." Jenner glared at him for a final time before spinning on his heel and shouting for his men-at-arms. Roveer was then left to his own reflections. The spear-beaks, he reasoned, hadn't fed for nearly seven days—since the Tallmans. There couldn't be all that many of the creatures, or else greater numbers of people and livestock would have been lost. Seven days. Still smiling, Roveer began to whistle happily.

The very next day, as the fiery globe that was Father Tirador inched above the horizon, Jenner led his six Realmsmen to the base of Heb's Crown. Little Roveer, the Alian merchant, trailed behind on his stout pony. They reached the base of the crown just before mid-day and quickly located the cavern.

"All right, Realmsmen. The creatures will be hanging from the ceiling. Once we get inside—load the crossbows. We'll fire off one volley, and that should bring the house down." Jenner grinned tightly and continued, "If one of you gets stuck, fall back immediately! Good Roveer will cut it off with his blade."

The Alian looked ridiculous—covered head-to-toe with leather armor, leaving only his thin face visible. He drew a nasty-looking dirk and added, "Don't try to be brave, my friends. The longer they stay attached to you, the weaker you become."

"Right," agreed Jenner to the assenting murmurings of the men. "Let's go."

The eight men carefully entered the cavern, and were instantly assaulted by the scent of blood. The cavern floor, as Val had said, was deep with the creatures' blood-red guano. Roveer paused to ignite his torch, and, seconds after it was lit, a loud chirping, similar to that of a cricket, echoed through the cavern.¹²

Crossbows at the ready, Jenner and his men advanced with caution as the chirping grew louder. It did indeed sound like a thousand of the monsters awaited them. Suddenly, a number of the creatures flew down upon the advancing men. Two quarrels were loosed before Jenner could yell, "Hold your fire! We won't hit them in the air! Spread out and draw your steel!"

"Don't yell!" screamed Roveer, forgetting himself in the excitement. "They'll pinpoint us and the whole colony will attack!" He hoped fervently that the spear-beaks had fed last evening, and that most would be sluggish and slow to attack.¹³

Almost as one man, the trained Realmsmen drew their swords; four of the monsters were sliced out of the air in quick succession. They were slow and clumsy fliers—bloated with the blood of recent victims. They quite literally burst, splattering blood all over the armored men. Quickly, the warriors entered the main chamber. Val had indeed exaggerated the number of the beasts, there were little more than a score of the beasts hanging above. They were all very awake—the chirping in the cave was deafening. Seven quarrels were loosed, and seven stirges died. The flock dropped, as one, and attacked. The fight was brutal and short. The stirges, slowed by their heavy meals, could not elude the singing steel of the Realmsmen. One of the older men, Sarich, slipped in the guano and fell to his knees, exposing the back of his neck to the blood-suckers. No sooner had one of the stirges attached himself, than Roveer leapt forward, applying his torch to the bird, whose feathers became engulfed in flame as it released its death grip.¹⁴

Sarich, only singed, looked at the Alian with something akin to respect. There were no other wounded; the stirges had been slow and seemed to have trouble locating a target for attack. Jenner was pleased with the afternoon's results. "Excellent, gentlemen! Let's make a casual sweep of the cavern, make sure we haven't missed any, and then get out of here!" The soldiers responded with a mighty cry and set about making a periphery search.¹⁵ Another pair of sol-

diers hefted a guano-encrusted corpse—Nured the shepherd. His father, Jenner knew, would want the body for a proper burial. Roveer handed his torch to Sarich and left the cavern, tracing his way back to the base of Heb's crown.

It was still early afternoon when Roveer emerged and surveyed the valley of Albanner. Turning in the other direction, toward Commonfield, he noted a large column of smoke. Smiling quietly to himself, he began to peel off the leather armor. After a few moments, Jenner himself emerged from the cave, carrying one of the creatures. His pleased smile and triumphant eyes did not move the Alian to guilt, but rather to curiosity and wonder that a warrior could be so naive.

The stirge had a wing-span of about two feet, and its entire body was covered with rust-red feathers. The "beak" hung limp from its face; when feeding the sharp point was plunged into the victim's flesh with the stirges' strong neck muscles. Its talons were a milky yellow. "Ugly, aren't they?" noted Roveer, indicating the bulbous eyes. "Just like a fly."

"Roveer," began Jenner seriously, "I'll confess I don't like you all that much, but we are all indebted to you for the knowledge of these stirges. You've saved lives."

"We were lucky that the spear-beaks had fed. It made our jobs easy." The Alian looked meaningfully at the smoke rising from Commonfield.

Jenner saw that smoke, and instantly understood—"jest like dry kindlin'" is how Legrin had put it. "You knew they would feed last night," he said in a quiet voice.

Roveer, however, was all smiles. "Now, my dear Jenner, how would I have known?" So saying, the Alian walked off to retrieve his hobbled pony.

Tim Richardson now resides in Virginia, where he is interning with the Senate Republican Policy Committee in Washington, DC.

12. The chirping alerts the others to danger and potential prey. Stirges who are "sleeping off" their latest meal are slow to react. See also note 13 below.

13. In addition to the surprise roll penalty described in the *MM*, I recommend penalizing their initiative roll by -2, and reducing their THACO to that of a 2-Hit Die creature. The maneuverability class of stirges drops to D following a full feeding.

14. Directly applied, flame always forces a stirge to release its prey and make a Morale check, but the

flame must be applied to the attached creature, which inevitably damages the victim as well.

15. A more thorough search might have located a few clutches of eggs. Like birds, female stirges lay eggs—between four and 12 at a time. They are typically buried by the female in the guano of the colony's roosting area. Mating among stirges is a communal affair, with many males and females mating repeatedly twice a year—once in the early spring and again in late summer/early fall. The parents

leave the eggs buried and abandon them. The eggs hatch in about three months. less than 20% survive into adulthood, feeding off the guano itself for several days until they are strong enough to fly and search for food on their own. Often, the young will kill each other for food. The young that do survive will either form a new colony or join the next one that enters the roosting area. Stirges reach full growth after about eight months and can have a life-span of five to six years.

The ecology of the stirge

by Ed Greenwood

From an address by the naturalist Elm-daerle to the assembled Guild of Naturalists in Arabel:

"... Understandably, little research has been done on the life and habits of that disgusting and dangerous creature, the stirge. I have endeavored to learn what I can of them, and have, as you can see, brought along a specimen.

"No, no, it's quite dead. . . . The stirge, as we all know, subsists entirely on a diet of blood, and will attack all warm-blooded mammals, although it seems to prefer man. Quite often, stirge swarms follow herds of domestic or nomadic animals — cattle, caribou, and sheep being most often afflicted; and where such herds are, one should always expect to meet, and be prepared for, these little fellows. Caravans, traveling pilgrims, and even armed war-bands have been harried through wilderness areas by large flights of stirges; we've all heard the gruesome stories of drained, white victims and a few lucky, narrow escapes. I've studied these creatures for some time, to get at the truth — and the tales and legends, I fear, are not far wrong.

"In flight, the stirge is highly maneuverable¹, and groups of them are capable of cooperative unison attacks and mid-air actions. As you can see, it is really little more than an expandable blood-bag with wings, eyes, and claws — for clinging onto prey — and a long, hollow needle-beak or

proboscis, admirably suited for drawing blood. This specimen appears to be of about average size, measuring just under one foot from top of head to tip of tail, and with a wingspan of just less than three feet. The wings may look unusually large, but if they were smaller, the stirge would not be able to maneuver as well as it does when its body cavity is filled with blood.

"The proboscis, properly treated, can serve as a sharp but brittle stabbing weapon, much favored, I am told, by goblins and similar unpleasant creatures. When the stirge is alive, the proboscis contains at its tip a supply of clear liquid, produced in the stirge's body and steadily replenished; this is an anti-coagulant, which mixes with a victim's blood to keep it from clotting in the proboscis or in the stomach where it ends up. The stirge, because of its diet, can transmit diseases — malaria, for instance — from one victim to the next.²

"Ingested blood passes straight into the stomach. This serves as a storage bag which the creature always tries to keep at least partially full. From this reservoir the creature draws small quantities into lesser cavities located just beneath its backbone. There its body processes convert blood sugar into body energy, and ingested blood into plasma balanced for its own bodily use, so that it can replace its own lost blood and hasten its recovery from wounds.³

"The interior of its wings is interlaced

with thin-walled blood vessels. By flapping its wings, the creature fans air over these surfaces, and thus cools its body when in hot sun or volcanic steam. Much of the tissues of the stirge are liable to be tainted with disease, but the knots of muscle here and here, just behind the head and atop the spine, at the bases of the wings, are humanly edible. I would have liked to bring a prepared, sample meal with me tonight, but I was unable to procure fresh stirges — and once a stirge's legs have stiffened after death, no part of its body is safe to eat.

"The creature's claws are not strong enough to be effective weapons for the beast, but they are firmly embedded in its legs and at the midpoint of the leading edge of its wings, and they enable the creature to maintain; tenacious hold once it has attached itself to its prey. The claws serve some cloth-makers and workers for carding wool, brushing away hairs from garments, and so on. They are not strong enough for the fanciful uses attributed to them in the tales of thieves — they are far too brittle and small to serve as grappling hooks for climbing-lines.⁴

"Stirges swarm to attack prey, which is why they are so feared — one can be a formidable foe, but a large group can be deadly to even well-defended creatures. Stirges usually lair in forests, disused castles, or caverns, and may incidentally possess treasure from victims who have fallen to them therein, or from hoards laid down before their arrival, but they are not intelligent enough to value, or bargain with, treasure as we know it. A ranger of my acquaintance tells me that stirges in deep woods like to drive prey into tangled ravines, so that the victims cannot escape readily, or find steady footing, room, and balance to defend themselves properly — and any treasure carried by these unfortunates may well be found among their bones at the bottoms of these ravines.

"Although a thirsty swarm of stirges may seem endless when they're all swooping down at you, typically only three to thirty nest together in a colony, from which they fly out in all directions to find food, usually in groups of three. By means of wagging their proboscis, stirges can communicate that

food or a dangerous enemy has been found, its direction, size or strength, and a degree of excitement or urgency regarding the desired reaction of the whole swarm. If a flight of three stirges finds prey, they will circle to observe it, and then two will harry, chase, or if it is strong merely fly along observing it, while the third stirge flies for home. Its message will spread via all the stirges it meets, and to all who call in home at the nest, and they will gather in a group to seek out the prey and kill it. Small prey is merely attacked by the hunting threesome for their own gain, and they give its location only later, if blood yet remains for their fellows.⁵

"Winter cold does not seem to affect stirges in any way, and they breed freely throughout the year. They reproduce by live birth, in litters of one to three young, with a gestation period of six months. Males and females are outwardly identical in size and appearance to our eyes. The tiny young cannot fly properly, but only glide, and are carried on the mother's back for up to four months, until their blood-drinking from prey⁶ provides sufficient nourishment for them to grow to about half of adult size. Then they can maneuver on their own, and in another three months at most they reach full adult size.

"I suppose that most of you have never seen a young stirge, and I regret that I could not procure one to bring as a specimen. The adults, however, you all should

know: pests feared by man and beast alike. My colleagues Ainsbrith and Bremaerel of Westgate are experimenting with poisoning stirges, but so far report limited success. Just as they are apparently immune to the diseases they transmit, so are they unaffected by the same poisons that harm us; the creatures seem both adaptable and of rugged constitution.

"And that, fellow naturalists, is a brief look at the stirge. As more information becomes available, I will share it with the group, and I will expect each of you to do the same."

Notes:

1. Stirges are flight class A; if their wings are damaged and/or they are fully bloated with blood, and/or they have only 1 or 2 hit points, they may be reduced to Flight Class B or C and 16" or 12" aerial movement rate, at the DM's option. A mother with young on her back (see text and note 6 below) is penalized even further, dropping down one more flight class and another 4" in movement rate, compared to what she would be if she were not so encumbered.

2. Diseases contracted from stirges will almost always affect the "blood/blood-forming organs" of the body (see DMG), and be of the *acute* type. There is a 5% chance for any adult stirge to transmit a disease to its victim on a successful hit.

3. Stirges can always regenerate lost body parts (over a period of 1-3 months) or heal

even the most severe wounds (replacing up to 4 lost hit points every 24 hours), so long as their heads and spines remain relatively undamaged, and food — i.e., fresh blood — is plentiful.

4. Stirge claws resemble the better types of fish-hooks, in that they are both hooked and barbed, curving to a point, which has a side-fin or point projecting backward from its tip toward its shaft, in the same way that the edges of an arrowhead form two points facing back toward the flight-feathers. In a live (un-stiffened) stirge, these barbs are not rigid, but can be retracted into the claw by means of strong cartilage-and-muscle linkages — thus, a stirge can hook itself into a victim through gaps in metal armor or by

Guidelines

If you're interested in contributing an article to DRAGON® Magazine, the first thing you need is a copy of our guidelines for writers. Send a self-addressed, stamped envelope to "Writer's guidelines," c/o DRAGON Magazine, P.O. Box 110, Lake Geneva WI 53147; and we'll send you back a sheet with all the basic information you need to make sure your manuscript has the best possible chance of being accepted.

Adventure Under

OTHER™ SUNS

An exciting new Science Fiction Role Playing Game in which players take the roles of any of 11 intelligent species (or robots) and find adventure in the L'Doran Hegemony.

Included are complete rules for the building of starships, space travel, space combat, creation of worlds and star systems, combat, skills, technology, and even careers. The range of career types with over 100 different skills and additional rules for psionic talents allow for freedom of character design and character goals.

The boxed set comes with the complete rules in two volumes, an included introductory scenario, master character sheet, and judge's screen. It all adds up to everything you need to begin a career of adventure, danger, and success under OTHER SUNS in the L'Doran Hegemony.

simply piercing leather or lighter clothing, so that it cannot be torn free except by also tearing away parts of its victim's flesh (1-2 points of damage per claw torn out, 4 claws per stirge). In determining whether or not a stirge's attack is successful, consider a missed "to hit" roll as indicating that the creature's claws failed to latch on to the intended victim or victim's clothing/armor. If a stirge hits successfully, it has grabbed on with its claws and struck with its proboscis in the same round; generally, a stirge's proboscis can strike into or through any surface on a victim that its claws can attach to. Immediately after death, a stirge's muscles relax, and it ceases both to drain further blood and to hold its barbs in — but if it is not removed from its victim within 4-6 turns, and is allowed to stiffen while attached, the barbs will have been extended again as the stirge's muscles convulse, and the body of the stirge will then *have* to be torn free of its victim, doing damage as specified above. If it is attached to armor, but not flesh, then the creature will be easily shaken or pulled loose by normal movement when its muscles are relaxed.

5. As many as six stirges can comfortably (for the stirges, that is) attach themselves to the body of one man or other M-sized creature at the same time. Sometimes more than six will do so, but usually only if the entire swarm is very thirsty, if the victim is a solitary creature, and if the victim has enough blood (i.e., hit points) so that each

of the attackers can drain at least a little blood. A charitable DM might rule that each stirge after the third one attacking a single target does so at a cumulative -1 "to hit" (-2 for the fifth, -3 for the sixth, etc.), because the target is, in effect, smaller since other stirges are already attached.

Stirges will attack the trunk of a victim's body in preference to the extremities, since the target area is larger, and those who sink their claws into a victim's back will be virtually immune to counterattack by the victim himself. A companion can try to attack the stirges on a victim's body, but if he misses such an attack and rolls 4 or more under the number needed "to hit," he hits the victim instead of the stirge, and the weapon strike will do half normal damage (round down) to the victim. The first successful attack by a stirge will be upon a victim's back 66% of the time (4 in 6 chance), or else on the front of the torso. If the first attack hits the front, the second successful attack will always be on the back. After that, other stirges will attach themselves to the extremities — but must always hit the victim's original armor class (not AC 10, even if the arm or leg being hit is unprotected). This "hit location" determination is useful in knowing whether a stirge's claws are embedded in armor or flesh.

A stirge filled with its quota of blood can subsist on that nourishment for as long as 72 hours, and can go another 24 hours without food after that before starving to

death. However, stirges will instinctively seek out new prey starting 36 hours after their last "full meal," at which time they will have digested half of their full capacity.

6. Although a litter of young stirges (stirgelings) can number as many as three, a mother can only carry two offspring on her back while they mature. The other one must survive on its own, or perish; other stirges will not transport the young in place of the mother. For every eight stirges encountered in a single group, whether in their lair or otherwise, one of those creatures will be a mother bearing 1 or 2 young on her back. When a mother carrying stirgelings scores a hit on prey, the young on her back can begin attacking on the round following her initial hit. Attacks from young are at -2 "to hit," they do 1 point of initial damage from the proboscis, and drain 1-2 hit points of blood per round on following rounds, becoming sated at 6 hit points' worth. The mother must be detached (killed) to stop the young from draining. If she drains her full quota of blood, she will remove her proboscis but remain attached to the victim until she feels her young also pull free, signaling that they have also drunk their fill. Stirgelings can easily be torn free from their mother's back, and typically have only 1-4 hit points. Stirges who fall from their mother's back without being slain will die unless they can find food (usually by crawling into burrows to attack young woodland animals). ❧

Feudal Lords

The original medieval pbm game of economic development, military conquest, and political intrigue.

Feudal Lords is a computer-moderated play-by-mail strategic game of power politics set in Arthurian England.

Each player is the lord of a medieval fiefdom seeking to become King against up to 14 other players and over 30 non-player lords controlled by the computer. To accomplish this task, a player may select from over 30 types of military, economic, and diplomatic orders each turn.

— The game is processed entirely by computer for fast, accurate, and impartial results.

— A two-page computer printout details each turn's economic results and reports all major battles fought.

— Armies may move by land or sea, limited only by the extent of their lord's political influence.

— Other features include random events, spies, vassals, trading, mercenaries, and more.

— Rated one of the four best pbm games as reviewed in issue #72 of **DRAGON** magazine!

The Ecology of the Su-Monster

Updated, revised — and ferociously evil

by Matthew Schutt

Please forgive any niceties of etiquette that may be compromised in this letter, but I am a desperate man and my desperation overrides diplomacy. As required, I will give details of my problem so that you may take into account every possibility in the solution I hope to receive. Also included with this message are the necessary and proper payments to do honor to the personage of an artifact and sage.

My dilemma: My barony has been denoted as "cursed" since its inception, and now the source of this curse is slowly destroying the fabric of this state. The barony of Hellegrammor is largely covered by a rugged, dense expanse of forest. This provides for a breed of people who are rough and well suited for the wilderness, such as trappers and hunters. Still, this race of outdoorsmen is losing a war against the wretched devils that inhabit the woods. The common name for these devils is the su-monster.

I am no naturalist, but knowledge of these creatures is common in Hellegrammor. They are the constant "black news" in every day's report, just as if we were at war or troubled with a plague. Thus, my family members have always been experts on this macabre subject, seeking some weakness to expose, some Achilles' heel to sever and end the monsters' apparent indestructibility. I will tell you what I know of them, gained by stealth and magic.

Su-monsters are filthy gray creatures, like large monkeys, quadrupedal in form, with rounded apelike muzzles and tails the length of their bodies. Adult males are, on the average, 5' long and 110-130 lbs. in weight, while females are slightly smaller and weigh 15-20 lbs. less than males. These monsters can live up to 30 years, but this is the exception rather than the norm. They are almost skeletal and always appear starved.

Their hides are normally dark gray, to blend with the dun of dawn or twilight. This color varies, from the almost black members of the deeper woods to the whitish-gray devils of underground caverns. Their faces and tails are always black, and their paws are a fierce crimson, as if stained by their bloody habits.

Despite their large size, most su-monsters are tree dwellers; even when underground, they prefer to make their lairs near the ceiling. This mode of life would not be possible without their prehensile tails, which are used as extra limbs. This tail is incredibly powerful, capable of holding the monster's own weight plus that of any large prey, in the grasp of its claws. The monster also uses its tail in balancing, maintaining posture, and even communication. The way a su-monster holds its tail indicates its emotional state and social rank in a complex set of gestures that my family and others have carefully documented.

Su-monsters live in small groups, called cadres or enclaves, though it might be

more correct to call them families, for that is what they are in a literal sense. A few families may join together to form larger groups, but the social structure within these groups is loose. Feuds over potential mates, slain prey, territory, etc., occur constantly. They have the same unruly nature as many humanoids: rule by the strongest, usually a male. These leaders never last long, and "leaderless" enclaves are common.

These unholy families are incredible hunting units. They can smell prey over a mile away, and their other senses are also acute. I've noticed that these senses grow even more sensitive in the colder months. They have had long ages to improve their ambushes, which occur primarily at dusk or daybreak. Belying their chaotic nature, su-monsters can organize a complicated ambush, perfectly timed by way of communication with certain calls and howls. These and other factors contribute to the fact that su-monsters, unlike other natural hunters, succeed in hunts more often than they fail.

The su-monster's menu is long, as they are omnivorous and are active all year round. They feed upon just about every animal in the forest, including other carnivores, insects, and humans, demi-humans, and humanoids. Their diet is balanced by grasses, lichens, and berries. Despite their looks, I have never known a su-monster to die of starvation.

Curiously, su-monsters rarely touch any prey in a lame, aged, or sick condition; nor do they touch carrion. They are neither stupid nor compassionate. Rather, I would say they prefer meals that go down fighting, boosting their appetites with combat. Then again, they may just prefer healthier meals. (This strange aversion does not extend to sleeping travelers, though.)

Su-monsters customarily devour a kill in one sitting. What cannot be eaten, they bury, often leaving no trace of their kills. Minor treasures from past kills may be found throughout the forests of my barony, just beneath the ground's surface.

Su-monsters are active sporadically, being neither truly nocturnal nor diurnal. They may sleep 3-4 hours at a time, then stay active for 6-7 hour intervals. They have no preference for day or night, and are able to see just as well at either time with enhanced night vision and color perception by day. When awake, su-monsters are incredibly aware and active—lethargy does not exist in these creatures.

These monsters breed throughout the year and have gestation periods of about 6-7 months, with infants being born singly. The parents are totally devoted to their young. The young depend on the adults for food, protection, and transportation, and stay with their mothers for at least two years. Males never abandon their mates, once chosen, and seem to share an equal burden of protecting and feeding young su-monsters. Transportation is left

to the mother; each young clings to its mother's back as she moves from tree to tree. As mammals, the young are fed by the mother's milk.

So far, I have neglected to speak of the su-monsters' deadliest talent. It is complicated to explain, and not much is known of it. This talent is a unique psionic attack, used only in the presence of others possessing psionic talents. Debates over its exact workings have been waged for years, with little progress. At first, it was thought the su-monster had a special psionic defense, reflecting back psionic attacks onto the user. This idea has been abandoned, however, as many non-psionists and psionists merely using a defense mode have been attacked in this manner.

Naturalists have examined the opened brains of the few su-monster corpses acquired by royal forces, and found no abnormal organ or development to explain this psionic prowess. The brain is, however, very much like our own, being highly convoluted and nearly the same size. This worries me. Only a tiny percentage of humans have psionics, but all adult su-monsters express this talent. What special knowledge do they possess?

In any case, I am no expert on the art of mind talents, but I do suggest that no psionics be included in your solution. In the past, people have lost their psionic talents, have been enraged to insanity, and have even been killed while attempting to use psionics on su-monsters.

The su-monsters have the intelligence of primates, the cunning of canines, and the physical power of the ursids (bears). Because of its speed, strength, intelligence, high durability and adaptability, ambush techniques, and brain-talent attacks, my great-grandfather referred to the su-monster as the "perfect carnivore." Even the barbarians in the area, who call it "ape-bear" and "wolf-in-the-treetops," show the creature the appropriate amount of fear and respect.

Su-monsters have no natural enemies, and man provides them with only a minor nuisance. Long, vengeful campaigns have been held to wipe out these beasts, but those quests are still unfulfilled. I led a great many of these awful crusades personally, when I learned first-hand the ways of the su-monster. My hunting groups were plagued by an inexhaustible supply of problems, most caused by the monsters themselves.

The search for their dens was not a simple one, though they commonly take the form of hollow trees somewhere near fresh water. Also, our projects were delayed in the winter months, due to a lack of food. The su-monsters had no such trouble, as they had the simple task of seeking out and devouring small animals while they hibernated. Because of their aversion to carrion and ill or wounded animals, traps and poisons would have to be used very cleverly.

Then, of course, there is the su-monster's ambush. Our hunting group lived in a perpetual state of paranoia, with sentries staring wide-eyed into the pressingly thick foliage, trying to discern shadow from su-monster. And then instantly, without warning, a cadre of the creatures would drop from the branches, hanging by their tails, and rake at our ears and bite at our scalps. It was difficult telling who was hunting whom.

The su-monsters also made constant raids on our encampments, usually during the day while we were out "hunting" them. Posting sentries helped little. They also have opposable thumbs, and their clawed digits are so dexterous that they can undo basic latches and uncomplicated knots: Our camps were more often destroyed than set.

Su-monsters move surprisingly well on the ground, so our plan of driving them from their trees with fire was useless. They are also accomplished swimmers, as we discovered when driving the grounded creatures to the shore of a lake, where we thought we had them trapped. And when our dogs gave chase into the water, the su-monsters gleefully took the time to drown the whole pack.

I apologize for the nature lesson and the melodramatics, but I wanted to leave no room for misconceptions. Su-monsters thrive on them. The other lords, my bordering associates, believe I have a useless obsession with these monsters. They, of course, may speak freely and boldly while their lands are hilly, treeless grasslands, no place for a su-monster. They do not receive countless reports from villages and

towns about the mayhem caused by these monsters. They don't have to put up with clownish opportunists, who wish to put their greedy hands into the barony's coffers with their special ideas on the su-monster's destruction (all have failed miserably — su-monster harpoons, indeed!) They are not kept awake at night by the sounds of the monsters carrying away livestock and babes with chaotic, cheerful abandon. They did not witness the death of their eldest son, being dragged up into the dark branches while the beasts howled with what seemed to be laughter.

Su-monsters have our intelligence but not our civility. They have no cities of their own but are slowly taking over mine. Many at my court are predicting the day when the su-monsters will swing freely from the chandelier in my own dining hall. If not rushed, your aid may be too late to save my homeland, much less my sanity.

I await your assistance, and remain your respectful and obedient servant, etc.

Appendix & footnotes

The AD&D® 2nd Edition statistics for the su-monster were published in PHBR5 *The Complete Psionics Handbook*, released in February. Some basic statistics are reproduced here: IN average; TR C,Y; AL C(E); AC 6; MV 9; HD 5 +5; THACO 15; #AT 5; Dmg 1-4/1-4/1-4/1-4/2-8; SA/SD psionics, ambush (-4 to victim's surprise), females can attack hasted for 6 turns if young are attacked, males attack *hasted* for 4 turns if females are attacked; flesh is poisonous (save vs. poison or fall ill, no healing for one week); SZ M; ML 8-10; XP 650; PHBR5.

Psionics: Level 2; Dis/Sci/Dev 3/1/3(2/5); A/D PsC,MT,PB/nil (immune to attack); Score = Int; PSPs 120; powers: enhancement (no cost), psionic sense (always on, no cost); 10% chance of one extra science, two extra devotions in psychometabolic discipline. All other notes given in this article are unofficial additions that may be used by DMs as desired.

The su-monster's movement rate of 9 is the same in the trees, on the ground, and in the water. In the trees, though, it may travel at MV 15 for 10 rounds up to three times per day.

Having the constant advantage of elevation, su-monsters may be given a +2 bonus to avoid being surprised in heavily forested regions.

The su-monster's favorite attack method is hanging by its tail and attacking with all four claws, as well as its jaws. One su-monster can normally attack only one target, unless a group of targets are unmounted and crowded within a 5'-diameter area. In this upside-down fashion, the su-monster's attacks are all upon the head and upper body area. If the victim is wearing a helmet, the armor class of the head is the same as that of the body, minus any shield and dexterity bonuses for the first round of attacks. The head is AC 10 (for the first round only; dexterity modifiers apply thereafter) if no helmet is worn.

Another common attack form used by su-monsters, especially when dealing with a small number of opponents, is the use of overbearing and grappling. The creatures dive from their vantage points and attempt to knock victims down, holding them prone for other attackers. If a successful overbearing attack is made on a mounted character, the character takes 1-4 hp damage and must save vs. petrification or be stunned for one round, unable to regain his feet after being thrown. Pummeling attacks are used only rarely by su-monsters and then only with small, hard objects, like large rocks and sticks. They are medium size to determine overbearing attack modifiers. For the rules governing unarmed combat, see pages 59-60 of the 2nd Edition *Dungeon Master's Guide*.

Su-monsters that have lived several generations in or near human or demi-human populations may learn to wield weapons crafted by these populations. A su-monster can use its tail with such care so as to wield either a hand axe, dagger, knife, or sap. The su-monster can attack only once with a weapon and cannot use its claw or bite attacks in rounds in which it uses a weapon. Also, su-monsters suffer a nonproficiency penalty of -3 when a weapon is used.

While they may flee combat, su-monsters do not surrender (they have no understanding of this concept), nor can they be subdued. If captured, a su-monster thrashes in its bonds until it mortally wounds itself.

THE ECOLOGY OF THE

TARRASQUE

Ancient, ageless, and unstoppable, all know to fear the unrelenting devastation that is the tarrasque. A creature of legend, associated with the greatest of heroes and the darkest of times, little is known of the beast widely held as the greatest of monsters. Reports of the monstrosity's powers and ways to slay it have changed over time, but tales of its brute destructive force remain ever constant. Yet, even the least likely rumors and purported banes are comforts for those who must face that which is ruin unleashed.

HISTORY OF THE TARRASQUE

Some of the oldest elven records are *ahltrekauth*, or "speaking gems." The few magically-accomplished elves and human loremasters who can awaken such stones hear voices of elves

TARRASQUE HUNT

Bam-bam-bam! Dreelix slammed the gavel down hard three times in rapid succession. "This meeting of the Monster Hunters Association is hereby opened," he intoned.

He pressed on with uncharacteristic haste: "We'll worry about the normal preliminary stuff later. What I want to know—" and here his eager gaze fell upon Willowquisp, Sponstayne, and Buntleby, to whom he had given an assignment the previous meeting—"is what can you tell me about the tarrasque?"

dead for eons, telling tales so old that the worlds those speakers inhabited have themselves died, crumbling to dust around extinguished stars.

One such gem holds an account that might describe the first appearance of a tarrasque, in a kingdom of elves, half-elves, humans, and halflings known as Aeritueur. This is its tale:

The Starfall Shield gleamed and sparkled day and night. The mightiest spell-crafting Aeritueur had ever seen—a wall of devouring magics to keep the Orgog and the Gnawing Ones out, that the valiant strength of our land not be sapped in ceaseless fight-

ing against such marauding monsters. There was much rejoicing, and wonderment at the titanic achievement—particularly after the fell dragon Larau Thoon sneeringly

dived deep into the Starfall, only to be caught, held frozen, and slowly melted away, despite every magic the wyrm hurled. Truly the Starfall was a barrier beyond compare, that girt fair Aeritueur on all of its mountain flanks, to keep us all safe.

Yet at the rising of the third moon after the crafting of the Starfall, something emerged from the dark woods in its most remote location, in the demesne known as Rondaeral, for he who lorded over it. An elf in tatters, with a shattered arm and so wracked with pain that he could scarcely shuffle, appeared out of the dying sparks of a *farstride* spell, to gasp out that Rondaeral was gone, devoured with all his household by a gigantic thing, a beast of great jaws that tore through castle towers and hill-tombs with ease, hurling down Rondaeral's castle and the town of Phondaeray around it.

"Rondaeral is laid waste," said he, "for the creature ate every shining knight who rode against it, without pause nor prudence, as it stalked on down the

KNOWLEDGE OF THE TARRASQUE

The following table shows the results of a Knowledge (arcana) check as it relates to the tarrasque. Information about the tarrasque is often held by scholars of ancient history, lore books from fallen kingdoms, and wild-eyed refugees many pray are mad. The tarrasque appears on page 240 of the *Monster Manual*.

Knowledge (arcana)

DC	Result
30	The creature you face is none other than the tarrasque, a powerful monster known for its unstoppable destructive capabilities.
35	The tarrasque sleeps for months or years at a time, awakening for several days between slumbers. During such time, it attacks and destroys all that it sees.
40	Mere sight of the tarrasque when it attacks can inspire terror in those who witness its destructive abilities, and its thick carapace keeps it safe from most spells.
45	The tarrasque has the most powerful regenerative abilities known, and can regenerate even after succumbing to a <i>disintegrate</i> spell or a death effect. The only known way to permanently destroy the tarrasque is to use a <i>wish</i> or <i>miracle</i> spell immediately after rendering it unconscious.

road devouring every elf, horse, housecat, and passing beast in the hamlets of Tauront, Aladriel's Gate, Narnath, and Luel's Tomb. I fled before it, and in the market-town of Oraunghglieir only just found time enough to prepare the *farstride* casting that brought me here, as

it gnawed and clawed its way through the buildings toward me, dashing down shops and turreted mansions alike with great sweeps of its tail. A hail of arrows they hurled against it, and a bright lance of brilliant-armored knights, and it ignored the one and smashed the

other with its talons ere eating the remnants. So much I saw before my magic snatched me away."

Now in the bright court of Shelaralieir, Highqueen of Aeritueur, tall and wise courtiers scoffed at this telling. Oh, their swift spells told them the one in tatters truly believed what he said—but they held that he must have been driven mad, or been enspelled, to see things far from the truth.

Yet no sooner had they dismissed his words than the chamber where far-striders appeared rocked at the arrival of a fair elven knight in scorched and riven armor, whose pleas for aid were shouts none could ignore. From Lothaund this one came, and he cried that they had seen Oraunghlieir torn apart and toppled from afar, and mustered all the battle-might of Lothaund, mages and swordwielders alike, to make war on whatever had hurled down Oraunghlieir.

A great beast they saw, stalking toward them like a wingless dragon larger than any seen before, ponderous and slow.

At first they could scarce believe that this one beast, however monstrous, could alone have been the bane of Oraunghlieir. Yet they hurled their spells at it, rode at it with lance and sword, sought to pierce it with volleys from their greatbows, and even spell-hurled savage monsters into its path, to force it to fight them—yea, even great dragons!

But the Great Beast devoured and slew and prevailed, laying waste to all before it, until it came at last to Lothaund, and breached its walls, and started to hurl it down. Thousands of elves perished fighting it, and more fled, this knight among them.

This time the wise courtiers looked troubled, and did not scoff when this sorry knight warned them that the bright court could not be saved, and perhaps not even Aeritueur itself.

War-trumpets blared and spells cried warnings afar, calling all the mailed might of Aeritueur to fight this one foe.

Yet even as a realm rose up in alarm, swords flashing, the Great Beast

strode out of riven Lothaund and into the nearest mountain—into it, sinking down into the solid stone as a swamp-snake glides down under inky waters. As suddenly as it had come, the Great Beast was gone.

For the first time. For all too soon, it came again.

PHYSIOLOGY OF THE TARRASQUE

By its physical build alone, a tarrasque might easily be mistaken for a dinosaur, towering more than 50 feet tall and measuring at least 70 feet from nose to tail. It stands upright on its powerful hind legs, with its body thrust forward and its long tail providing a counterbalance. In general stance, it moves much like a tyrannosaurus, although its front limbs are significantly larger: while a tyrannosaurus has stumpy forelimbs unable even to reach its own head, the tarrasque's arms are long enough to touch the ground as it stands erect, and in fact the creature has been known to "knuckle walk" in the manner of some apes.

TARRASQUE PLOTS

The tarrasque is legendary for its single-minded rampaging and the fearsome destruction it wreaks. Here are a few ways to introduce this destroyer into a campaign.

Arcane Glutton: A sudden surge in spellcasting or the use of a rare magic item in an area "awakens" a tarrasque. It cuts a path of destruction toward the center of the heaviest magic use, devouring all living things. It continues its rampage until either it is sated or no magical source exists in the region for it to consume.

Artifact's End: The PCs come into the possession of a powerful but evil magical treasure that can only be destroyed within the tarrasque's stomach. Unfortunately, the tarrasque was last spotted mere months ago and is not likely to reawake for years.

Defending the Realm: The tarrasque has a special relationship with a kingdom, serving as its monstrous defender. Stealing a crown or other royal regalia, spilling royal blood on a throne, or slaying or kidnapping royalty causes the appearance of a tarrasque that stalks those responsible.

Ritual of Ages: A group of nihilistic tarrasque monster cultists (see *DRAGON* #296) seek to permanently awaken and worship the tarrasque as it brings about the end of civilization.

Covering the tarrasque's dorsal half is an exceptionally thick, highly reflective armored carapace covered in massive spikes, while twin horns of similar size and shape jut forth from the creature's head. The horns are used offensively, while the carapace serves a defensive role—not only against physical attacks, but also against many magical attacks as well.

The tarrasque's carapace has been described as looking like "melted diamond" (by those lucky enough to have encountered the creature and lived to tell the tale), which accurately describes the carapace's toughness, reflectivity, and overall smoothness. In truth, the tarrasque's carapace is not made from diamond—melted or otherwise—having a unique composition.

The bodily processes of a tarrasque can readily digest all organic matter, living and dead, creatures and plants—even wood that has been painted or varnished. The lone destroyer's immunity to poison leaves it unharmed by dyes, paints, molds, other growths on decaying organic matter, and so on. A tarrasque has an expanding gullet that holds creatures and objects swallowed whole, which tumbles such devoured items around and around in a continuous spiral, working them down into a succession of three stomachs. These stomachs are among the most effective destructive engines in the multiverse and little—even the most powerful magical artifacts—can survive within.

The uppermost stomach is a hot, wet place of tumbling stones and internal spines (the stomach wall seems lined with thousands of bony knife-blades) that breaks down large objects; its walls are durable and very strong, with moving knots of muscle that can literally punch, squeeze, and claw at swallowed items. This stomach can shatter large rocks down into smaller stones, break clods of earth into scattered motes,

crack bark and bones, dismember bodies, and puncture containers so as to spill out and separate the contents. Belts and ropes are typically sawn into shorter lengths in this stomach, and glass is shattered. Metal items and glass shards are typically moved on swiftly to the deeper stomachs.

The middle stomach of a tarrasque is a churning, energetically pulsing fleshy cauldron of corrosive acid. Unique in all the planes, this fluid possesses a disjunctive property, capable of stripping the magical powers from consumed magics. Here everything breaks down.

The last stomach of a tarrasque is a long, winding, rhythmically-thrumming tube of great heat, where anything that survives the previous stomachs—typically only the strongest and rarest metals—meets its end. The acidic slurry boils off and is absorbed by the creature.

It takes a tarrasque mere moments to force what it consumes through its devastating digestive process. Despite the swiftness of this metabolism,

the vast majority of the energy is stored. While it takes a great deal of food to keep an active tarrasque sated, tarrasques are actually quite docile—this stored energy sustaining them through deep, decades-long hibernations.

When preparing for such a hibernation, a tarrasque employs one of its most unusual and rarely witnessed abilities. Once fully gluttoned and ready to go back to sleep, a tarrasque gains the ability to earth glide in much the same way as xorns do: it burrows through stone, dirt, or any sort of earth except refined metal or continuous veins of pure metal as easily as fish swim through water, without disturbing or dislodging anything or leaving a tunnel or hole in its wake. This lets the beast access subterranean caverns its bulk would normally not allow it to reach. Lacking a large enough cavern to lair in, it can earth glide until buried, to “be at one with the stone” (sharing space with solid rock, a condition referred to as “arnstone” by some dwarven sages). This

is why there is so much debate and mystery surrounding the location and nature of a tarrasque’s lair.

While in arnstone state, a tarrasque does not suffocate, but sinks rapidly into a torpor in which its bodily processes slow and it hibernates until the need for new nourishment awakens it into the “burrowing” state again. In damp rock, where mineral-laden waters percolate, and with a belly filled with the ruins of a large town or city, this need might not arise for as long as 50 years. In dry or caustic rock, or if a tarrasque is disturbed by tremors (including the relatively minor vibrations of nearby rock or creature movements), shifts in temperature, or actual wounding (direct damage from the pick of a dwarf prospector or the weapon of an adventurer, for example), awakening might come much sooner.

A tarrasque’s carapace and outer hide are clearly visible to earth gliding or quarrying creatures who reach one’s immediate vicinity. Earth gliding creatures cannot glide into or through the volume of earth or rock occupied

by an arnstone tarrasque; its body seems "solid" to such creatures, who are deflected aside from it.

A tarrasque comes out of torpor with astonishing speed if disturbed, typically taking only 1d4+1 rounds to become fully aroused. While awakening, a tarrasque has the same properties and vulnerabilities as when sinking into torpor. A waking tarrasque is unpredictable; it might move away from the disturbance, turn to confront it, or "flee" at high speed for some time and then try to settle down into torpor again.

PSYCHOLOGY AND SOCIETY OF THE TARRASQUE

A tarrasque's actions are all driven by one need: nearly insatiable hunger. It has an intellect just above that of an animal and instinctively sees all other creatures as food. (Of course, it also sees trees and plants as food, buildings as food, rocks and dirt as food, and so on.) Given its powerful regenerative abilities, it has little to fear from combat with most creatures, and even those that have the capability of killing it—like high-level spellcasters—don't register as anything other than another type of potential food. Thus, a tarrasque never retreats from battle, no matter how events might turn against it.

A tarrasque is by no means an evil or vindictive force. It is no more a source of evil than a hungry wolf or lion, although this view is difficult to maintain by those whose homes, families, and entire lives have been destroyed by such a ravenous beast. The only real enmity the tarrasque ever feels toward its living victims is reserved for creatures capable of flight. Since the tarrasque has no method of ranged attack, any creature capable of flying beyond its reach has nothing to fear—a fact that annoys a hungry tarrasque to no end.

Once the tarrasque has its fill—a process that can normally take up to a week, during which time it remains completely awake and continually alert—the creature begins to get drowsy and prepares for a long sleep.

So long as it is not currently in battle (as its primitive brain refuses to allow it to depart from a fight while there is still living morsels to ingest), it finds the nearest chunk of solid rock big enough to support its massive bulk and settles down within for a lengthy hibernation.

ADVANCED TARRASQUE

The tarrasque is widely held as the toughest monster in *DUNGEONS & DRAGONS*, despite there being creatures in the *Monster Manual* of higher CRs, not to mention dozens of other deadlier beasts in other books. As the tarrasque can be advanced to have any number of Hit Dice, presented here is a CR 30 version ready to challenge even epic-level heroes.

Attack, Toughness (x6)

Skills Listen +25, Search +16, Spot +25,
Survival +21 (+23 following tracks)

Regeneration (Ex) No form of attack
deals lethal damage to the tarrasque.
The tarrasque regenerates even
if it fails a saving throw against a

disintegrate spell or a death effect.
If the tarrasque fails its save against
a spell or effect that would kill it
instantly (such as those mentioned
above), the spell or effect instead
deals nonlethal damage equal to
the creature's full normal hit points
+10 (or 1,549 hp). The tarrasque
is immune to effects that produce
incurable or bleeding wounds, such
as mummy rot, a sword with the
wounding special ability, or a clay

golem's cursed wound ability.

The tarrasque can be slain only by
raising its nonlethal damage total to
its full normal hit points +10 (or 1,549
hit points) and using a *wish* or *miracle*
spell to keep it dead.

If the tarrasque loses a limb or
body part, the lost portion regrows
in 1d6 minutes (the detached piece
dies and decays normally). The
creature can reattach the severed
member instantly by holding it to
the stump.

Improved Grab (Ex) To use
this ability, the tarrasque
must hit a Huge or smaller
opponent with its bite attack.
It can then attempt to start
a grapple as a free action
without provoking an attack
of opportunity. If it wins the
grapple check, it establishes a
hold and can try to swallow the
foe the following round.

Rush (Ex) Once per minute, the
normally slow-moving tarrasque can
move at a speed of 150 feet.

Swallow Whole (Ex) The tarrasque can
try to swallow a grabbed opponent
of Huge or smaller size by making
a successful grapple check. Once
inside, the opponent takes 2d8+8
points of crushing damage plus
2d8+6 points of acid damage per
round from the tarrasque's digestive
juices. A swallowed creature can cut
its way out by dealing 50 points of
damage to the tarrasque's digestive
tract (AC 25). Once the creature exits,
muscular action closes the hole;
another swallowed opponent must
cut its own way out. The tarrasque's
gullet can hold 2 Huge, 8 Large, 32
Medium, 128 Small, or 512 Tiny or
smaller creatures.

Augmented Critical (Ex) The
tarrasque's bite threatens a critical
hit on a natural attack roll of
18–20, dealing triple damage on
a successful critical hit. Improved
Critical doubles this to 16–20.

Carapace (Ex) The tarrasque's armorlike
carapace is exceptionally tough and
highly reflective, deflecting all rays,
lines, cones, and even *magic missile*

spells. There is a 30% chance of reflecting any such effect back at the caster; otherwise, it is merely negated. Check for reflection before rolling to overcome the creature's spell resistance.

Frightful Presence (Su) The tarrasque can inspire terror by charging or

attacking. Affected creatures must succeed on a DC 36 Will save or become shaken, remaining in that condition as long as they remain within 60 feet of the tarrasque. The save DC is Charisma-based.

Skills The tarrasque has a +8 racial bonus on Listen and Spot checks. 

"...That's all the information we have," explained Willowquisp, closing his oversized tome of unusual creatures. "Might I inquire as to your interest? Surely you don't intend a tarrasque hunt?"

"Why not?" asked Dreelix, puffing out his chest. "We are, after all, the renowned Monster Hunters, and the tarrasque is merely an oversized monster. You yourself said it could be killed with two spells in quick succession, a vindication of the power of spellcraft over brute force if ever I heard one."

"We'd be well out of our league..." began Spontayne.

"Pshaw!" scoffed Dreelix. "Two wish spells and we're in business!"

"Sadly," pointed out Spontayne, "wish is beyond our capabilities."

"So we take some money out of the coffers and pick up a couple of scrolls," dismissed Dreelix. "No big deal." At that, Grindle the Coin-Counter expelled an involuntary "Eep!" As the Association's treasurer, he was well aware of the current sad state of their coffers.

"What, may I ask, is the sudden fascination with killing the tarrasque?" asked Buntleby.

"As it happens," replied Dreelix, "I was cleaning out my study, and discovered this ancient tome from my old mentor." He pulled a dusty manual out from under the head table, opening it to a diagram of the fabled beast and flipping it around so the others could see. While Spontayne and Willowquisp leaned forward to examine the book, Buntleby instead studied their illustrious President. Dreelix seldom mentioned his old mentor, preferring that others assume he had never needed such assistance in mastering—if that was indeed the appropriate word—the wizardly arts. For him to so casually mention he had once required tutoring could only mean his attention was focused elsewhere.

"Look at this passage here," Dreelix said, pointing at a fading section. "Killing the tarrasque releases a fortune of diamonds hidden in its shell!"

"Why would it have diamonds in its shell?" queried Spontayne, puzzled.

"It's not as easy as you make it out to be," scowled Buntleby. "The tarrasque isn't a piñata—you can't just whack it open and get your toy surprise."

"In any case," scoffed Willowquisp, "This book is rather outdated. It was useful for its time, but now the 'facts' contained therein are considered to be mere legends and fables nowadays, nothing more."¹

"Hmmp!" glared Dreelix, grabbing back his tome.

"Tell you what," suggested Spontayne. "If you can find it, we'll kill it."

"Hmmp," Dreelix repeated, then pressed on with the rest of the evening's agenda.

NOTES

¹ Apparently Dreelix's tome is similar to the 1983 version of *Monster Manual II*, written by Gary Gygax for first edition AD&D. In that venerable work—the tarrasque's first appearance in D&D—treating the monster's carapace with acid and heating it in a furnace yielded 10d10 diamonds valued at 1,000 gp each!

THE ECOLOGY OF THE

TITAN

*"I will advance a terrible right arm
"Shall scare that infant thunderer, rebel Jove,
"bid old Saturn take his throne again."
—"Hyperion," John Keats*

Few beings can contend with the children of the multiverse. What are even angels or demons—mere spawn of mortal virtues and vices—to do in the face of a titan's godlike fury? Dragons, as old as mountains and wise as the wind, are revealed as mewling babes when matched to a titan's time-less intellect. Immortal, brimming with untold power, and as unpredictable as a storm-tossed sea, the titans are feared even by deities, and are understood by few. Theirs is a tale of divine

battle, deific vengeance, and eternal exile. Cast out of paradise to brood, rule, and destroy, they walk the world. Only fools do not bow before them or flee at their approach.

HISTORY OF THE TITAN

In a time before time, long before the churning cosmos found its form, gods and goddesses reached into primordial chaos and sculpted perfection from its mutable essence. Thus, the titans were born. The deities adored them more than creation itself. The titans' every whim was doted upon. Their wishes were granted even before they formed in their minds. As time wore on, the titans grew more demanding of their deific progenitors. No boon seemed too great to ask.

The titans rose to a respected place at their masters' sides to help rule over creation. As feuds broke out among the gods and goddesses, the titans led their divine armies in battle. The mightiest among them grappled with deities, proving victorious on too many occasions to comfort godkind at large. As the greatest titans realized their power rivaled the gods, their demands became increasingly unsettling.

Eventually, the titans committed offenses their makers could no longer ignore. The titans created children of their own nearly equal to themselves in glory and power, birthing the first giants into the world out of shards of their own celestial essence. The titans loved their new children as dearly as the gods once lavished affection upon them. They promised their offspring an entire plane of existence, a world where the giants would rule as deities in their own right.

KNOWLEDGE OF THE TITAN

The following table shows the results of a Knowledge (the planes) check as it relates to titans. Information about titans is most likely to come from servants of ancient deities, planar scholars, and residents of Arborea or Carceri. The titan appears on page 242 of the *Monster Manual*.

Knowledge (the planes)

DC Result

- | | |
|----|--|
| 31 | This gigantic creature is a titan, a being of fickle whims and unbridled power. This result reveals all outsider traits. |
| 36 | Titans are incredibly strong, capable of destroying nearly anything they encounter with their physical strength and magical prowess. This result reveals several of a titan's noteworthy spell-like abilities. |
| 41 | The titans were among the first creations of the deities and rebelled against them. Those who survived this war were scattered across the planes. |
| 46 | Cronus, the most powerful of the titans, still rages against the deities in a Carcarian prison forged millenia ago. |

The gods were outraged. The power to create was theirs alone. The deities looked on the giants as abominations and their fury was boundless. Still, they could not bring themselves to punish their beloved titans. The deities offered a compromise:

they would spare the giants but cast them down to the Material Plane, not to rule, but to exist among thousands of other lesser races. The deities had begun to regret their mistake in creating children rivaling themselves in might and begat

POWER OF THE TITANS

Some titans possess unique sets of spell-like abilities different from those given in the *Monster Manual*. These titans lose *etherealness*, *levitate*, *meteor swarm*, *persistent image*, and *summon nature's ally IX* but gain the following spells in their place.

Stormbringer: Some titans are tied to the fury of the storms. They gain the following spell-like abilities:

At will—*control weather*, *gaseous form*, *water breathing*, *wind wall*

3/day—*whirlwind*, *wind walk*

1/day—*storm of vengeance*

Iconoclast: Refusing to be shackled or controlled, some titans possess powers that make them impossible to manipulate.

At will—*break enchantment*, *freedom of movement*, *greater teleport*

3/day—*mind blank*, *destruction*

1/day—*freedom*

new offspring, far inferior to the titans in power. The titans were not satisfied. Their rage at the offer was doubled by the gods' designs to spawn new children to vie with the titans. The titans saw the creation of these new races as an attempt to supplant them. For the first time, the titans felt their place in the cosmos threatened. They raised their mighty fists against their divine masters. The gods found themselves under attack.

The heaven-shaking conflict that followed lasted an age. Thousands of titans and hundreds of gods perished before the conflict finally came to a halt. The face of creation was savaged, and the multiverse nearly unraveled. Finally, though, the gods emerged victorious.

Realizing they could never risk such a cataclysmic event again, the deities convened a divine tribunal and after much deliberation decreed the titans would be scattered across the infinite planes—the most dangerous among them imprisoned on Carceri for all time. The gods and goddesses also summarily hurled the giants to the Material Plane, robbing them of any vestige of divinity. Those few titans who stood by their makers during the war earned reprieve and were allowed to remain on Arborea. Slowly they earned back their fickle divine masters' trust, while their brethren were condemned to wander for eternity, forever scorned by their deific parents.

PHYSIOLOGY OF THE TITAN

Titans are specimens of absolute physical perfection. They are the pinnacle of

might, agility, mental acuity, and will. Their form is a mirror to glory. The vainest mortals labor through staggering regimens of exercise and employ epic magic in hopes of even drawing close to the physical magnificence and comeliness of titankind. These sad fools always fall dismally short. Titans' muscles are denser than adamantite and more pliable than the supplest bamboo. They see in the dark as well as any fiend, and in light a hawk is nearly blind by comparison. When pleased, their voices are like honey poured over a golden lute's strings. When enraged, their bellows shatter mountains and shout-down any tempest's thunder.

Among the strongest of any other creatures, titans delight in their varied prowess. They revel in their near-godly might and enjoy flouting their physical superiority over creatures twice their size. Titans take great pride in besting gargantuan dragons in contests of physical mastery.

Titans are as eternal as their divine masters. They do not age, nor do they require sleep or sustenance, although they often enjoy rich food and guzzle barrels of sweet-nectar spirits for sheer pleasure alone. More malicious specimens enjoy eating those who dare an audience, casually picking them up and pulping their heads as a man might enjoy a succulent grape.

PSYCHOLOGY AND SOCIETY OF THE TITAN

Titans were birthed from raw chaos. There is no constant by which one might rate a titan's emotions, and

predictability is definitely not among their flaws. For a titan, a morning of towering rage begets a mirthful midday meal, and an evening of unquenchable lust. What pleases them one moment is just as likely to draw their ire the next. Parlaying with a titan is dangerous, and pity those who must negotiate terms with these frenzied forces of the universe. A titan's courtesy might be more civil than any king's at first, but guests can never tell when their hosts might take it upon themselves to mash them flat, just to see what shape the stains their pulped bodies make on the floor.

The only exception comes when titans treat with one another. For some inexplicable reason, titans (even those with divergent takes on good and evil) regard each other with great civility and respect at all times. No titan knowingly crosses another unless a direct challenge is made. These challenges are almost always accepted. When titans clash, the world trembles and others would do well not to come between them.

A key factor in titans' views of the world is their immortality. They are timeless and have existed since the dawn of creation. They have watched civilizations rise and fall, borne witness to the extermination of entire races, and seen gods dethroned. They are blessed with a god's lifespan and unburdened by any responsibilities of divinity. Needless to say, little surprises a titan and nothing impresses one. A novelty they have not before witnessed, with which to stave off the tedium of eternity, is worth more than a mountain of diamonds. Many bards risked their lives in attempts to earn a titan's favor with an unheard tale or song. Most ended up smeared into gory paste as punishment for their failure.

Titans believe (rightly so) that they are superior to all mortal beings. They love to challenge mortals to impossibly difficult (and often deadly) competitions. Defeating a titan in one of these contests earns respect—and a possibly a boon.

ADVANCED TITAN

Cronus first gained his moniker of God-slayer after he castrated and killed his

own father, Uranus, a god of the Sun. His act of patricide ignited the war between gods and titans, and Cronus led his people's revolt for centuries. He felled more than one hundred gods in personal combat. He basked in the fiery rays of Pelor's hottest flames, mocked Obad-Hai's mightiest blast of tree-rending wind, and fought five thousand passes with Heironeous and Hextor long before the half-brothers forsook their kinship and swore eternal enmity. His fury could not be slaked, and time and time again he repelled the gods' assaults and shattered every attempt of theirs to imprison him.

Finally, the deities bent their ear to Kurtulmak, cunning kobold god of traps, who concocted one of the most brilliant snares ever conceived. The gods ambushed Cronus en force. While the dwarf gods drew his ire, Boccob, Garl Glittergold, Olidimmara, and Wee Jas wove their most powerful enchantments, melded flawlessly with potent illusions. Fharlanghn leveled powerful translocation magic upon the titan as well. Cronus was instantly transported to a powerful prison the gods prepared

in Carceri. There, Cronus, his mind vexed and eternal form weakened by powerful spells and illusory effects, believes he still wages his war against the gods. For millennia he has "battled" in a dreamscape of the gods' collective design, ensorcelled for all time.

Or so the gods hoped. They believed eventually the titan would tire of his war or, better, be slain in phantom combat. Instead, Cronus has fought through the ages, brutally slaying the gods one by one in his phantasmal prison. The gods watched grimly as each of them fell to Cronus' glaive, and now their numbers dwindle. If the titan slays every phantom god, the potent magic befuddling his mind might crumble. When it does, Cronus' rage at the gods' trickery promises their doom. He will shrug off the mighty shackles of Carceri's greatest prison and regain his powers to menace the heavens. The gods have seen their doom in their own illusionary trap, and they fear they might not be able to stand against Cronus. Perhaps a band of mighty champions whose powers rival the deities themselves are creation's only hope.

EPIC FEATS EXPLANATION

Cronus employs several feats from the *Epic Level Handbook*, here is a brief summary of their effects:

Chaotic Rage: Your weapon deals +2d6 points of damage while you rage.

Damage Reduction: You gain damage reduction 3/—. This feat stacks with itself.

Devastating Critical: When you score a critical hit with the weapon you have selected, the target must make a Fortitude save (DC 10 + 1/2 your character level + your Str modifier) or die instantly. Creatures immune to critical hits can't be affected by this feat.

Epic Weapon Focus: Add a +2 bonus on all attack rolls you make with the selected weapon.

Fast Healing: You gain fast healing 3.

Overwhelming Critical: You deal +1d6 points of extra damage on a successful critical hit. If the weapon's critical multiplier is $\times 3$, add 2d6 points of extra damage instead.

Terrifying Rage: Any enemy that views you while you are raging must make a Will save opposed by your Intimidate check or become panicked (if it has fewer Hit Dice than you) or shaken (if it has Hit Dice equal to or up to twice yours) for 4d6 rounds.

gate, maze, meteor swarm (DC 27)
3/day—etherealness, word of chaos (DC 25), summon nature's ally IX
At will—bestow curse (DC 22), chain lightning (DC 24), charm monster (DC 26), cure critical wounds, deeper darkness, fire storm (DC 26), greater dispel magic, hold monster (DC 23), invisibility, invisibility purge, levitate, persistent image (DC 23), unholy blight (DC 23)

Rage (Ex) When he rages, Cronus's stats change as follows.

AC 62, touch 7, flat-footed 59
hp 1822

Fort +58, **Will** +41 (+45 versus enchantments)

Melee +15 Colossal adamantite glaive +103/+98/+93/+88 (6d8+62 +2d6 against creatures of lawful alignment/19–20/ $\times 3$ + 2d6 + DC 69 Fort save or die)

Grp +101

Abilities Str 77, Con 58

Skills Climb +65, Jump +70, Swim +59

Unmovable (Ex) Twice per day, Cronus can add a +20 bonus to: avoid being grabbed with the improved grab ability; avoid the effects of a bull rush, trip attempt, or similar effect; a Strength check to avoid being moved physically or magically; or a saving throw.

Unstoppable (Ex) Twice per day, Cronus can add +20 to his Strength check to break or burst a door or item, make a DC 32 Strength check to break a wall of force, or apply a +20 bonus on a single attack roll.

Change Shape (Su) Cronus can assume the form of any Small or Medium humanoid. He retains his oversized weapon special attack regardless of form.

Oversized Weapon (Ex) Cronus can wield an oversized weapon one size category larger than himself (Colossal) without penalty. 

The ecology of the TRAPPER

by Ed Greenwood

"Yes, I can tell ye 'bout the Crushing Death — oh, I may not look like anything much now, boy, but in my day I was a fierce and bold sword-swinger, afore that beholder took off my arm, here . . . oh, yes, big it was, and strong, and we who went up against it just as foolish and headstrong and stuck-up-nosed as you and your friends are now. . . Ah, it's gold ye have fer me? Good, good . . . a respectable sum — and fer that ye'll have a respectable tale. Listen, then — and mind ye, this is as true as I know.

"The Crushing Death in yonder hole is nothing more than a gigantic trapper — yes, I see ye've heard of *that* name. Mind ye, this one is old, and big; it's been there fer twenty winters at least now, to my certain knowledge, and a lot I've seen go and try to kill it — but I've not seen 'em come out again. But never mind that fer now. I must be earnin' me gold, so listen:

"A trapper is a thin, flattish critter, big enough to cover the floor of a good-sized roomy. Its top, the part ye'll see first, looks and feels like stone, as though lots o' flags was laid down, with little ridges and lines just like the real thing.' It's tough an' horny, not real brittle like rock, an' some — dwarves 'n' stonecutters, mostly — can tell it's not stone when they hit it or try to take out a chip.²

Under its top layer it's a soft thing, somethin' like a jelly-fish, that can change shape and slide around to fill holes and lay on top o' rough ground, bones or such, so the top of the trapper seems to be flat and

level, like the floor — until it's too late.

"Yep, they slide around, and that's how they move from place to place, but ye'll never see one move like that when it knows ye're around — they can feel when ye walk on 'em, but sometimes I think they know when ye're comin', too.³ Your trapper will lay still, jus' like a part of the floor, mebbe with a special little hump in the middle that looks like a box, or somethin' else it thinks you'd like, and when ye reach fer the box, it'll close up around ye an' squeeze ye jus' like yer hand squeezes a piece o' ripe fruit. So, keep a few staves and bars in hand, or ye'll have no room to use your weapons.⁴

"What's that? . . . Well, I never heard o' someone findin' it in time — it can spread itself out almost as thin as parchment at the edges, so ye can't tell where the trapper stops and the real stone starts, unless ye get down an' take to chippin' an' pryin' at the edges, but then the thing'd jus' roll up around ye, an' it'd be all over . . .

"When it takes victims, the trapper crushes 'em to death, twistin' around so's they can't move an' squeezin' the breath right out of 'em. Then somehow⁵ it gets the body an' other stuff from its topside to its underside, an' it eats what it wants an' keeps or leaves the stuff it can't eat. The thing forms its body around the stuff 'neath it, but stays flat an' hard on top, so ye can't tell the stuff is there by lookin' or walkin' across the trapper.⁶ If ye think ye're standin' on one, an' it hasn't made a move fer ye yet, stamp down hard an' jump about — the floor won't give, but ye might hear

snappin' an' crackin' from underneath if the bones 'n' other stuff give way. Then ye better jump quick, or ye've had it!

"The trapper eats what it catches by oozin' out some kind o' burnin' fluid it makes inside itself, but this fluid only comes from the underside, so's when yer trapped at least ye don't have to worry 'bout that, too. If it gets on top o' ye, alive or dead, the fluid won't hurt right away, but don't let it in yer eyes — it can blind ye fer days if a lot gets in there. Back when I had me two good arms, I pulled a feller out from under the edge of one just in time.' He was wet, but he had his eyes closed from bein' knocked out, and the fluid didn't have time to burn 'im. Don't try to save the stuff if ye manage to get some — when the thing's dead or when the fluid's taken out of it, somethin' goes with it, and no matter how ye mix it, or what ye pay your alchemist, the killer juice is just so much sewer-water.

"I seen somethin' more, too — somethin' ye don't hardly ever see, how a trapper makes little trappers. It don't mate, it just eats an' grows an' eats an' grows till it's too big. Then it splits into a lot of little trappers — I said I seen it, and I seen it, I tell ye! — and they all go off their different ways, to find new huntin' grounds.⁸ They kin hide, changin' color to match the ground they're on,⁹ till they find a good place . . . so, ye won't see one just comin' down the street, but if ye go in there, over yonder, an' poke around a bit inside that cavern, ye might not find the big one ye're lookin' for — but if ye see a little one, be sharp, 'cause there's

bound to be three or four more jus' like it creepin' around hereabouts, an' not a cave or ruined hall'll be safe till they're all dead.

"Good luck to ye all — ye'll be back, soon, I think! And if ye do come back, wander in here an' tell these old ears how ye killed it — an' I'll give ye this gold right back as payment for the tale!"¹⁰

Notes

1. The top surface of a trapper is dense, horny (not brittle), and effectively as hard as stone. It is shaped in irregular, flagstone-like plates or lumps. The trapper absorbs heat and vibration, and thus suffers only half damage, at most, from actual fire; it won't be harmed by normal pressure from being walked upon or prodded, nor does it give appreciably underfoot. It is also resistant (half or no damage) to cold and cold-based attacks; its metabolism does not need a particular body temperature to function, and chilly underground environments are its normal habitat.

2. Small parts of a trapper's rocky surface can be chipped away without the creature being harmed noticeably (no visible wound occurs, just an apparent cavity in the rock); the stony substance grates or rings, like actual rock, when it is struck. Characters who are very familiar with stone (dwarves, gnomes, miners, stonemasons, and sculptors) can usually tell immediately that something is not right when they test the surface — by chipping or striking it, but not merely walking upon it. Characters not familiar with stone may (5% chance) sometimes realize that they have attacked something alive, but trappers are not easy to detect, even when they are being looked for.

Infravision will clearly detect the underside of a trapper if the creature is viewed from beneath (through a hole, for instance), rolled up around something, or when the underside is revealed around its edges when it moves. (When it is stationary, the hard top surface covers all of the edges.) The heat-absorbing top surface of a trapper is not revealed by infravision; it always matches the temperature of its surroundings, absorbing excess heat (or reflecting most of it, in the case of flame or extreme heat used as an attack form) and simultane-

ously transferring it, along a one-way path, to the underside. In its reaction to extreme heat or cold, the top layer acts as a barrier and a permeable membrane at the same time.

3. A trapper can sense — and, because of its high intelligence, usually interpret — even the slightest vibrations, such as a mouse running across its surface; the hard top surface transmits these vibrations to sensory organs in the actual body of the creature before the vibrations are dissipated or absorbed. The trapper is apparently not sensitive to sound waves or odors, but it can sense light up to 4" (40 feet) distant. Light-sensitive patches on the top of a trapper report the presence of light to the trapper's brain, which acts in conjunction with these patches to govern the shifts in color that a trapper's body is capable of (see note #9). The patches can detect very small amounts of light — flickering torchlight or narrow lantern beams, for example — in an area that is otherwise dark, but cannot sense the presence or location of prey by this means if the entire vicinity is illuminated, such as in daylight or when a *light* spell is in use. Also, full illumination makes it more difficult for a trapper to quickly shift color without being noticed as it moves onto new surfaces. For these reasons principally, trappers prefer to dwell in dark places, and almost always underground.

4. Iron bars or even stout staves will provide a precious few rounds of "safety" from a trapper's attack, if at least one of them is close at hand so it can be used to obstruct the creature's attempt to close around a victim (as a piece of wood might be jammed into a creature's mouth to keep it from closing its jaws). While this bar or staff is in place, the character(s) it protects can still wield weapons against the trapper. Thrusting and piercing weapons are the most useful in this case, since they are used along the axis described by the bar or staff. Weapons that slash or smash are not as effective (-2 on damage, but a minimum of 1 point of damage per hit) because the wielder doesn't have room to swing the weapon with full force. In some cases, common sense must prevail in determining whether a weapon is wholly or partially

effective; long pole arms, for instance, would probably be useless.

A bar or staff used as an obstruction (DM's decision as to what is suitable) will automatically afford one round of safety for the character(s) it is protecting. Thereafter, the object must save vs. crushing blow once per round (as "hard metal" or "thick wood," as appropriate), with a cumulative penalty of -3 per round to the die roll beginning with the second save. Thus, a staff of thick wood will "survive" for as long as five rounds before the pressure of the trapper's muscles on its ends will cause it to snap or slip out of position. (The first round of protection is "free"; thereafter, the staff must make saves of 10, 13, 16, and 19 to remain intact and in place for the next four rounds. On the following round it will need to save with a 22, which is impossible unless the save is made at a bonus.)

5. Apparently our grizzled old adventurer has never seen exactly what a trapper does with the prey it captures. When a trapper's victim is suffocated, or when the victim takes enough damage to be rendered unconscious or killed, the creature relaxes its hold on the prey and then flexes and moves in such a manner as to slide out from underneath the body. Then the creature reverses direction and moves back on top of the victim, loosely encasing it in the more pliant undersurface of its body. This underside is subject to attack by characters outside the trapper whenever the creature is wrapped

around someone or something. However, the underside is just as hard to damage as the top side; lying just beneath the tough, leathery "skin" covering the underside is a network of strong muscles which, when they are tensed, are just as difficult to penetrate with a weapon (AC 3) as the top side is.

6. When a trapper moves on top of an object, it can use its pliancy and its amorphous nature to "flow" over and around the object, varying the thickness of its body (if desired) to keep the hard top surface even and level. The top surface will not give way under the force of foot-stomping or jumping, but in places where objects lie beneath it and relatively close to the top surface, some of the force of those blows will be transmitted through its body to the objects below, and those objects will crack or shatter if they are fragile enough. As noted by the old adventurer (and the Monster Manual), the trapper can also exercise the ability to form its body into shapes that appear to be lying on its top surface. Sometimes, the creature uses an object it is concealing as a foundation for one of these "sculptures" — for instance, using a broken pillar or a log as the basis for an extension that looks like a stone bench.

7. The trapper consumes its prey by moving on top of a victim (see note #5) and then exuding an acid-like enzyme that breaks down organic matter. The chemical reaction caused by the fluid does not begin until after a victim is exposed to it for five

rounds (which is why our hero was able to rescue someone "just in time"); then it begins to burn and corrode, doing 6 points of damage per round to any victim that is not already dead. A single man-sized creature can be entirely consumed in this manner in 2-4 turns; one L-sized creature or a small group of M-sized victims will take 6-9 turns to be consumed.

When it "eats," the trapper re-absorbs the digestive enzyme along with the substance it has acted upon, and then the nutrients and the enzyme are separated during its digestive process. The fluid finds its way back into the sacs in which it is contained, until more prey is to be consumed. The enzyme loses its potency within seconds when it is exposed to air, which is why a victim can be rescued without suffering damage from the acid, provided the chemical reaction has not already begun. The enzyme has an immediate effect only if it gets into a victim's eyes, in which case the victim (if he survives) is totally blinded for 1-4 days thereafter; a *cure blindness* or *heal* spell, or similar magic, will offset this effect.

Again, note that a trapper is highly intelligent and will act accordingly — it will not attempt to "eat" anything but motionless (unconscious or dead) victims; it will not try to trap something in its top surface and consume something else beneath it at the same time, because the digestive enzyme loses its "power" when the underside is exposed to the air. The creature is never

ravenous (it can survive for days or even weeks without a single "square meal"), but neither is it ever satisfied; as soon as one meal is finished, it is ready and quite able to consume another.

8. The activities of a trapper are controlled through its network of nerves, which gather together into three or more centers or nodes. One of these, the dominant, sentient directive center, is the creature's brain. This brain is highly developed, particularly in mature trappers — able to receive and interpret sensory input, and capable of decision-making. (If a trapper senses the presence of a large party of adventurers, it can and often will choose to lie quietly to avoid the possibility of being slain, rather than attacking.) As a trapper grows larger and older, its secondary nerve centers grow and develop until they also achieve sentience — whereupon the trapper splits into three or more little trappers. These instinctively move away from each other to establish their own territories; one will not knowingly locate next to another trapper. It is not known if trappers fight over territory or prey, but they seem to avoid each other whenever possible.

9. A trapper can alter the color of its top surface (the underside is always a sickly mottled pinkish and greenish-white) by producing pigmented liquid that it stores in bag-like organs within its body and forces by muscular action to and from its "stone" surface. Unlike the digestive enzyme (see note #7), this liquid does not lose its special properties when exposed to the air, so it can be salvaged and used (see note #10). The trapper's natural, unaltered top-side color is that of its underside, only slightly more brown-grey. It can shift hues through browns (sometimes with traces of dark green) to greys, all the way to jet black — but it cannot make its top surface glossy or smooth. It can never be white, translucent, or transparent as a result of pigment shifts. Trappers can exist under water, and are known to lie inches deep in partially flooded rooms or caverns; in such cases, they are virtually impossible to detect.

10. Speaking of gold pieces, adventurers who are victorious over a trapper will be rewarded if they think to recover some of its pigmentation liquid. It will fetch a handsome price (about 6 gp per pint) in quarters where it is known as an ingredient in the making of a *robe of blending*, and as an alternative ingredient in the manufacture of various spell inks (such as that for *Bigby's crushing hand*). Any portion of trapper flesh (the underside) can be used in the making of a *rug of smothering*, *rug of welcome*, or *net of entrapment*. Some magical practitioners have claimed, in writing, that intact trapper brains (preserved in vessels of nutrient liquids) can be linked to doors, pit traps, deadfalls, treasure niches, and the like so as to control their operation, but details of such arrangements and the process of establishing them (if they do indeed exist) are unknown to most magic-users at the present time.

The ecology of the treant

by Susan Lawson

"Slow down! I have to rest *now*," said Clarissa as she staggered to a halt. She unslung her backpack and dropped it heavily on the ground near the roots of an oak tree, then sprawled next to it in exhaustion.

With a sigh and a faint smile, Andrar stopped as well. He set his longbow carefully against another tree and looked around at the forest. It was late spring, the air was warm and dry, and a breeze occasionally stirred the leafy sky above them.

"I was under the impression that druids liked to walk long distances in the woods," Andrar remarked casually as he surveyed his companion.

Clarissa, a halfling, panted for a moment and then muttered something about "long legs and no brains." Andrar grinned and shook his head, which only made Clarissa repeat herself in a louder voice.

"Shame, shame," the half-elf teased as he took a seat on a fallen log overgrown with ferns. "The woods have ears and might be offended to hear such talk."

"They do, for a fact, and I don't care," said Clarissa. She sat up and shrugged out of her green cloak. "I hurt all over from trying to keep up with you. We're not going to a party or something; we're just here to look for mistletoe. We don't *have* to hurry."

Andrar grinned at her again. "I apologize," he said, then continued in a less serious tone, "Do you really think the trees can hear us?"

Clarissa rubbed her shins as she looked around at the seemingly endless wood,

and nodded. "It is very quiet here," she said. "We've seen no sign of evil in this forest, and the trees are well tended. No broken limbs, no blight, the undergrowth is thinned away, and there are no signs of fire damage anywhere." She paused, both for a breath and for effect. "Treants. At least one travels here, probably more."

Andrar looked around with considerably more interest now. "Can you tell where they are?"

The young druid shook her head. "They know where they are. We could have passed a dozen of them already and

never known it, if we weren't looking carefully. Privacy is their greatest treasure. If we were to go wandering into a treant's cave, which isn't likely, they would shoo us out and be in a bad temper; if we were orcs, we'd be worse off than that."

Andrar leaned back and looked up into the green canopy. "Have you ever met a treant?"

"Yes." Clarissa stared into the distance, remembering. "When I was initiated into the druidic service of our goddess, Sheela Peryroil, I was taken by my parents to see Alkharn the Ancient, a treant who lived in a great wood by my home. The druids of our village accompanied me. They made a gown of daisies that I wore to see him, and they gave me a potion of resisting fire to offer Alkharn on behalf of myself and the other druids. Alkharn, I was told, would help decide whether I was fit to take up the shillelagh."

"Alkharn was immense, and he was older than the oldest elf. He said he remembered things from as long ago as ten thousand years, and he knew the names of all the kings of the land in all that time, of every race. In order to help him recall them all, he had made the names into a long verse, a memory-helper . . . a nem-something . . ."

"Mnemonic," offered Andrar, proud of himself. If Clarissa noticed the smirk that came over his face, she ignored it.

"That's the word I was looking for. It was a *great* poem. Alkharn said that treants have to create these poems. They have long memories anyway, but they live so long that they'd still forget things if

it wasn't for their mnemonics. I remember part of what he recited to me:

*'Hero-king, Telaring, silver-eyed,
elven-born,
Goblin-foe, steady bow, ruled long
the North.'*

"The poem went on and on. It was almost frightening to think of all the ages of time he had seen, and how things had changed so much since his earliest memories. He knew more about his own woods, though, than about any human or elven empires. The rest of the world was a vague memory to him, but Alkharn knew the names of every tree in his wood, and all the ones that had been there since his time began.

"He even recited part of his great poem where he had remembered the names of the trees he had met, but he said it all in his own language and I couldn't understand a word of it. When he spoke to me in my language, it was in a slow and rhythmic drone that I had trouble understanding, but it sounded very relaxing."

Clarissa absent-mindedly smoothed the hair on her feet and brushed the dust from her legs as she continued. "Alkharn said that treants knew many languages, even those of the bears, the birds, and the druids. He told me about the special language that treants share with trees and other treants — nothing spoken, but they wave their limbs and leaves, and touch and make rustling sounds, and all of it just to say 'Hello, how are you?' "

Andrar broke in, remembering one of Clarissa's earlier remarks. "Why did you say treants lived in caves?"

"They don't, really; they live in the outdoors most of the time, but groups of treants keep large caves, in which they store mementoes, brew their drinks, and stay safe from their most feared enemies, lightning and fire. The treants know that fire is often good for a forest, but this is true only for those forests that have no treants moving about to clear away thick undergrowth and decayed wood."

For a moment Andrar was silent, then thought of a story he heard long ago. "My father once told me there was great power in the drinks of the treants. Some who were allowed to drink from their wooden bowls found that they grew stronger, or that they could speak with plant life, and some lived far longer than they and others expected them to. My father said that one of his friends drank from a treant's bowl when he was wounded, and found himself healed of his injuries within seconds."

Clarissa nodded. "Your father's friend was blessed to share drink with them. Only those they trust completely are allowed to do that. Usually, they don't even communicate with ordinary folk, unless one is of the druidic profession like myself, or perhaps a ranger-type, or a bard, and they generally prefer to share their forests with elves, rather than humans or dwarves — or even halflings."

"I didn't think that treants were able to create magical things, though," said Andrar. "That has always confused me. How can they make these potions?"

Clarissa chewed her lower lip, searching for words. "It's hard to say, and I guess no one really knows *exactly* how. Treants make their potions from their own living sap, and add many sorts of materials that they find in the forest or receive in trade from friends like elves and dryads. Some say the drinks must age for many years before they are ready to be consumed. The effects the potions have upon people like you and me are probably related to the effects they have upon the treants themselves. A draught made to give a treant energy would gift me with the strength of a giant. I could throw boulders, bend bars, poke bothersome companions in the nose . . ."

Andrar grinned and tossed a twig at her. "Have your fun. But tell me more. Where do treants come from?"

"They just appear, as far as anyone knows. A young tree that has grown up straight and strong might someday start waving its two largest branches like arms, blink two eyes that were once just thin spots in its bark, and shuffle forward on a trunk that has split into two legs. When it does these things, it has become a treant, but no one — not even the oldest elf or the wisest druid — can predict if any particular tree will do that.

"Any sort of tree can become a treant, and treants have seeds like a tree. But those seeds do not grow into treants. The seedlings grow into trees, and only a few of them ever develop into treants. Then, as a treant gets larger and much, much older, it reaches a time when it turns back into a tree once more, forever. It takes thousands of years for a treant to pass to this stage, and they do not fear it as we fear death. For all we know, they simply fall asleep and dream, for as long as their tree-lives continue.

"This very tree," she said, patting a gnarled and dirty root beside her, "may once have been a great treant. The tree is certainly big enough, and the trunk seems to have a division where legs might have been, here near the base." Clarissa gave the root a final absent-minded pat and then stood up abruptly. "Well, that's all I have to say, and we're supposed to be looking for mistletoe."

Andrar, now the reluctant one, got to his feet slowly, then turned and on impulse called out to the forest. "Hail, treants! My blessings for your work! The gods grant that you may yet walk another thousand years among us!"

His exhortation over, Andrar reached for his bow — and froze. A rustling sound grew in his ears. The leaves above the halfling and the half-elf moved as if stirred by a quick wind, and then the sound rose into a storm of nature-noise: branches rippled, squirrels chattered, and birds called out to one another. The two

travelers felt no breeze against their faces, yet the blast seemed to stir every tree in the wood. After a few minutes, the display subsided except for the calls of the excitable sparrows and larks.

Clarissa's eyes were wide. "By Sheela's daisies! They *did* hear us!"

"I thought you *knew* they were listening," said Andrar, just as shocked.

"I was just guessing, or hoping," she said, picking up her pack slowly. "No need for us to be afraid. The treants are watching out for us, and they wanted us to know that. They just startled me." She hoisted her backpack onto her shoulders and sighed. "Back to mistletoe hunting."

With some of their composure restored, the companions set out again into the woods. This time, it was Clarissa who remembered her manners. She paused at the edge of the clearing they were leaving, picked a daisy from her pocket, and tossed it back the way they had come.

"Good-bye! We'll be back sometime!" she called. Then she and Andrar disappeared into the trees.

APPENDIX

The list below can be used to determine which potions are found in a treant lair, and what their effects on characters would be if they were consumed. Note that any of these treant "drinks" can affect any character who imbibes one, regardless of class.

1. *Extra-healing*
2. *Giant strength* (Hill, Stone, or Frost)
3. *Growth*
4. *Healing*
5. *Longevity*
6. *Plant control* (this potion has no effect on treants or trees controlled by treants)

Treants vary widely in appearance, having variable numbers of branch-like fingers or root-like toes, different types of leaves, and so forth. Individual personalities may vary widely as well, from joyful and outgoing to quiet and introspective.

The only substance besides their potions that treants consume is pure water, which they drink through their "feet" (roots) and mouths. They have no great like for other liquids, and cannot tolerate salt water. Drinking is important enough to them that their words for "understanding" and "listening" are derived from their word for "drinking."

One of the greatest gifts that may be offered to a treant is a *potion of fire resistance*. In exchange for such, treants may offer their services, anywhere within their woods, to good or neutral characters. This offer will be quickly and forcefully revoked if the recipients are careless with fire, cruel to the forest, or prove themselves later to be of evil intent.

Treants and algoids will cooperate if both reside near a lake or swamp. The algoids' immunity to *fireballs* and *lightning bolts* makes them valuable allies. m

Sensitive subjects

"I thank you, gentlemen and ladies, fellow members of the Korbelian Order of Magecrafters, for allowing me time for this presentation, and for your attendance," he said, peeking out at his audience from behind the pillars at the edge of the darkened theater's stage, "I must further inconvenience you by asking that you refrain from the casting of any light-producing spells for the duration of the seminar. They would . . . detract from the display.

"As I am not often found here in Khanahr, permit me to introduce myself," he said, his barely visible outline stepping from the wings to stand in the darkness at center-stage, "I am Farrand Two-Spell, a wizard of good standing in this Hall."

"A technicality," remarked one audience member, sotto voce.

"Some few of you," Farrand continued, "may be familiar with my name by way of the spell I designed years ago, jokingly referred to by some as *Farrand's freeloader*, but more properly named *Farrand's cognitive conveyance*, and that dweomer has a role in the story I am about to tell you. Until recently, I had amused myself by seeking the answers to problems unsolved by my predecessors, including even the archmage Korb himself, but now I have come across a problem of my own which I ask your help in dealing with.

"Some centuries ago, a sage by the name of Arneerus, compiled a lexicon of the troglodyte language." At this moment, a troglodyte appeared to the left of Farrand's position, apparently from nowhere, advancing menacingly towards the audience and then blinking out of existence, only to reappear in its original position.

"A beginner's illusion", heckled the same voice in the audience, "there's no sound, and the animation is hardly life-like. It couldn't convince an ankle-deep farmer, let alone a trained wizard."

"And," continued Farrand without pause, almost as if he hadn't heard the remark, "he was surprised to find that troglodyte speech apparently traces itself back to a highly degraded form of a prim-

THE ECOLOGGY OF

THE TROGLODYTE

by Spike Y. Jones

illustrated by James Holloway

itive lizard man tongue."¹ A second creature then appeared, a lizard man poised on Farrand's other side, going through the same short rush at the audience before instantly returning to its place.

"Arneerus was surprised, because all of the anatomical sciences seemed to show that the two reptilians were no more closely related than humans and gnolls." As he spoke from his shadowy position, the reptilians on either side began to strike poses that mimicked each other and displayed the differences between their body structures.

"A second peculiarity that the sage pointed out was that troglodyte speak their own, lizard-man-derived language and absolutely no other. The language of the lizard man has evolved somewhat since it was learned by the trogs, changing in some aspects. At that point, the two beasts proceeded to intone pairs of words in their languages to show both the similarities and the differences.

"Sound. Nothing spectacular about that," sneered the heckler.

"There's nothing spectacular about a cantrip," commented a mage near the man, sparks dancing on his fingertips, "until I employ it on you."

"On no occasion has it been recorded that a troglodyte learned even a single word in a foreign tongue. Even when lizard men adopted from humans the common word 'halfling' to describe that race," (the lizard man made a smooth but

recognizable reptilian parody of the word, after which the illusory figure dissolved into the surrounding darkness), "the trogs coined a phrase to cover the new species from other lizard man words: 'bad smelling little humans'," (a phrase which was followed by the troglodyte figure making a similarly long speech).

"In addition, there were numerous troglodyte words, apparently of trog, not lizard, origin, that simply baffled Arneerus. This, combined with the mysterious lack of many basic lizard man adjectives and adverbs, made his *Beginner's Troglodyte* a primer for a pidgin-troglodyte at best. No one has yet managed to decipher even a single of these extra terms, and woefully few new words have been discovered to fill these gaps. But flawed though it is, it has remained the essential tract used by those desiring to communicate with those creatures even to this day, centuries later.²

"Seeing the gains to be made by the man completing the translation of Troglodytian, I set myself diligently to the task.

"At first, I explored a number of blind passages that I should have had the sense to avoid entirely. After all, if the accomplished lexicologist Arneerus had forgotten to try a *comprehend languages* or *tongues* spell on a captured specimen, then I might as well try speaking the common tongue to them and hope he'd

Continued on page 82

1. The relationship between the troglodyte and lizardman languages is only a slight one, more easily detectable by linguists than by adventurers. If a character speaks either of these languages, he will be able to understand 10% or less of the other.

While the troglodyte language can be transcribed by others, troglodyte themselves have no concept of written records.

2. That version of the troglodyte language which can be taught to humans and the like

expresses less than 50% of the total content of troglodyte speech. Exceedingly simple statements, such as 'I surrender', 'you surrender', or 'I kill you', can be translated, but complex, intricate discussions are impossible.

overlooked that obvious avenue as well. And my results duplicated those of Arneerus; even the more powerful of the two spells left inexplicable gaps in its translations, gaps that corresponded to the gaps in Arneerus' lexicon.

"Taking my studies to the field, I went to a wild area a day's travel from my home, the place from whence my captured subject had originally been taken. After preparing a secure hiding place for my body, I cast my *cognitive conveyance* on the troglodyte and then released him, so that I could, from within his mind, follow him to his home and experience his interaction with others of his kind in a natural setting, hoping thus to learn the intricacies of his language. Although I counted Troglodyte among the languages with which I was as fluent as any other human, I supplemented my fluency with a *comprehend languages* and the most powerful *extension* spell of which I was capable, the better to interpret the missing nuances of the language I was sure I would soon hear.

"After only a few minutes of travel on the part of my host, we crossed a field of wildly growing roses to enter a honeycomb of tunnels inhabited by a community of almost three score of these creatures."

Slowly, a dim image of a branching tunnel made itself visible to the right of Farrand's still-shadowed and stiffly-motionless form, moving and changing to match the description his monologue made. And the whole while, the slightly more animated image of the troglodyte stood to his left; a constant reminder of what the audience was watching for.

"The first thing that I noticed as we entered the caverns was darkness," Farrand said as the illusion of the craggy lair disappeared from his right. "Although I would have panicked on my own, my host's mind was entirely at ease, and it was not long before I realized that the darkness wasn't as unrelieved as it had first appeared. Various patches of the

darkness slowly grew into wispy, red clouds and other shapes, and I realized what the misty redness was. Under more pleasant circumstances, I had used the *cognitive conveyance* to experience a number of things through the eyes of a young, elvish woman of my acquaintance, and this recalled one of those experiences; *infravision*."

"Something smells off in here," commented the heckler quietly enough not to raise the ire of his neighbors.

"For those of you who have *infravision*, what you enjoy is but a pale reflection of the *infravision* of a troglodyte," Farrand said, as a series of shifting pictures in numerous subtle shades of red, orange and yellow filled the space to his right, "I estimated that troglodyte could differentiate temperatures as little as a tenth of a degree apart, so that surfaces that would appear uniformly cold to even an elf's eye, such as the ceiling, walls, and floor or a rock tunnel, would reveal enough thermal variation to allow a troglodyte to navigate as well as a human on a moon-lit night.

"Of course, such navigation took some getting used to, as *infravision* is not a fast-acting sense like our normal vision is, but this didn't seem to bother the troglodyte at all because, much as we use hearing as an adjunct to our sense of sight, his *infravision* was secondary to his sense of smell.

"Corners in the tunnels were marked off by scent-markers and we could even smell around corners if we were downwind of them, more than once detecting approaching trogs long before we could see or hear them. Conversely, my host tended to be more cautious approaching corners we were upwind of, as neither his *infravision* nor his keen sense of smell afforded him any advantage in such a situation.³

"I stayed with my host for a considerable time experiencing many little details of his normal life. I ate a meal of raw meat with him, raw because

troglodyte shun cooking fires or other sources of heat sufficient to blind their *infravision*.⁴ I relaxed with him by smelling samples from a collection of flowers, rocks and furs, each scented subtly different in ways our language hasn't the vocabulary to describe.⁵ And we talked with other troglodyte.

"At first, the conversations were just as confusing from the inside as they had been in all my previous attempts; I again heard nearly incoherent conversations in which key words, descriptives, and even whole sentences seemed to be missing. The troglodyte talked about things common to all species: their previous meals, their . . . uh . . . mating successes, their possessions, etcetera, but they left out important details like whether they liked the taste of the meal, what their mate looked like, or even exactly what possessions each one had.

"But the key to the missing words came when I realized the name of the individual I was being conveyed by. I never heard his name spoken, but more than once, at a point in the conversation when a name would have been expected, I smelled a curious blend of fragrances. It took a number of repetitions before I had both separated the different scents, and realized that these scents were the name of my host in the real language of the troglodyte. His name was Rose-Boiled Cabbage-Mild Skunk, and this was all accomplished by the troglodyte's bodies manufacturing these scents and releasing them into the air as if they were words!

"For a time I was stunned by this, but afterwards, I was able to decipher a large number of other words. For every word that is missing in their spoken vocabulary, there is a corresponding smell to take its place. There are smells for objects, places, persons, animals, and even emotions. Apparently, the original language of the troglodyte was entirely olfactory, and the verbal component was only borrowed from the

3. Because smell is such an important part of troglodyte sensory input, they arrange their lairs to facilitate the distribution of important scents. Caves are selected or modified so that the primary direction of air circulation is from the main entrance towards other, smaller exits and air vents, so that the foreign scents of intruders will be wafted to the defenders almost immediately. The savagery that troglodyte display when attacking humans has lead some to assert that they hate humanity, but the situation is actually the opposite. Humans smell and taste especially savory to troglodyte (human scents being used as superlatives when discussing other meats in the troglodyte scent-language), causing them to react with particular vigour and violence when those scents are sensed.

4. It is because of this avoidance of fire that

troglodyte are generally armed with stone weapons, and that they raid the communities of other races in order to get worked metals for themselves. They are incapable of forging their own metal weapons, as their *infravision* is blinded by the searing heat of a forge.

Instead, they make most of their weapons by stone-chipping, an activity they can accomplish with minimal light and a keen sense of touch. Their javelins are all wood except for the head which they make from sources as diverse as well-crafted human spears and points broken off of daggers. The javelins are not spectacular of themselves (in fact, they look somewhat crude in many cases), but troglodyte are so skilled with this weapon that trogs have bonuses both to hit and in damage with them.

It is also because they cannot process their own

steel that its possession is considered a sign of status and power within their communities; as the only way they can get metal is through combat (what would they offer in trade?), its possession is a sign of a warrior's prowess.

5. While magical translation aids, such as *Comprehend Languages* or *Tongues* spells, can make the spoken words of intelligent creatures understandable to the caster, they do not give him any new communicative abilities he did not previously possess. In the case of communicating with troglodyte, a human spell-caster doesn't gain an improved sense of smell from casting a *Comprehend Languages* spell, nor can the spell's magic invent new words to cover concepts unfamiliar to the caster, such as the thousands of variations of scent that only a troglodyte can differentiate.

lizard man in order to give them some form of ability to communicate with those outside of their own race.⁶

"Once I had firmly grasped this concept, and had learned enough of it to form a base for a new treatise on troglodytian conversation, I made ready to abandon my host's body and return to my own, safe in the woods outside. Even more stunning than the discovery of the secret of the troglodyte language was the realization that I couldn't extricate myself from my host! There is a time-limit involved in the use of the *cognitive conveyance* such that it becomes progressively more difficult to end the spell as time goes on. And I had apparently been so engrossed in the wonders of troglodyte sensibilities and society, that I had failed to keep track of the passing hours; I was trapped."⁷

"Hey, the smell's getting worse," exclaimed the heckler, "I think he's brought the worst part of the troglodyte cave back with him to prove his silly story."

"If you think that this speech is merely an attempt to authenticate some claimed discovery," responded another of his fellows, "then you're a greater fool than Farrand is about to reveal himself to be."

"At first, I didn't panic. I merely paused for a few moments to renew my mental energies, and then tried again to escape my prison, but to no avail. As my repeated efforts proved fruitless, I changed the direction of the task I set myself. Instead of trying to escape my host, I tried to invade him entirely, hoping to take over the mind and body I had passively shared up until that moment. I spent more than a few frus-

trating days trapped voiceless and bodiless within the beasts mind and at times it felt like he would eject me from his mind to go none-know-where, but I finally succeeded; I became the mind of Farrand Two-Spell, saddled with the body of a troglodyte named Rose-Boiled Cabbage-Mild Skunk.

"This accomplished, I exited the complex (incidentally called Roses In Profusion by the troglodyte, from which all of the tribe members drew part of their name; the field of roses cultivated outside the cavern being a signpost and beacon for the benefit of travelling troglodyte), to retrieve my body, return home, and solve this new predicament.

"The journey was more difficult than one would readily imagine. While my troglodytian body could see well

Continued on page 86

6. This scent language is central to the troglodyte, and apparently evolved from such basics as the similarity of scents within a clan or family, the easily identifiable scents of fear and passion, and the common animal ability of tracking other animals by the foreignness of the other's smell.

Among troglodyte, the scent-language is so versatile that it takes precedence over all other forms of communication. Guards cry out alarms in a shrill olfactory "voice" without making a sound, thereby alerting other troglodyte within smell range (about 20' away per round as the smell drifts, to a maximum of 80', after which it blends in too well with the background scents to be identifiable) without alarming relatively smell-blind humans. In fact, the overpowering stench that can reduce a human opponent to weak-kneed vomiting during combat with troglodyte, is merely the build up of olfactory battle-cries, combat orders, screams of rage, pain, and hunger, and other smell/phrases which are spoken/emitted in such profusion that the combined smell overpowers non-troglodyte.

In fact, a similar effect would occur at any time troglodyte "speak" too fast for the ventilation in their lairs to accommodate, the equivalent of the noise level in a crowded room full of humans, something which can cause headaches even to the participants. Even a single troglodyte can cause such a build-up of smells, if he is kept in a poorly ventilated area for extended periods of time.

When fighting troglodyte place increasingly more stock in this form of information gathering rarely making any noise, in order to concentrate on the immediacy of scent; they pay as much attention to what they see during combat as humans do to what they hear. Thus, light would have to be particularly bright (eg: a Light spell cast directly on their eyes) to cause them significant discomfort, and this discomfort is only half what other subterranean beings suffer from in similar circumstances (-1 to their "to hit" rolls and armor class, or no effect if a saving throw vs. spells is successful), causing effects more akin to deafness than blindness for a human.

If fighting under conditions in which their sense of smell is overwhelmed (eg: if their opponents have spread skunk oil in the vicinity, or if they've set a number of different things aflame, releasing thick clouds of multi-scented smoke), they will put more stock in their infravision or their weak normal vision, but if anything threatens these senses as well (such as Light or Wall Of Fire spells), they will immediately retreat.

As they can easily tell which of their opponents are the most afraid of them by the fear scents all release, they will usually concentrate their attacks on the most fearful, which usually proves to be a good tactic as these are also the weakest of their enemies. (In game terms, the DM should require

Morale rolls when NPCs face troglodyte, not to have them run away, but merely to determine which is the most fearful. In the case of player characters, the DM should judge on the basis of known PC abilities, and on the reactions of the players.)

Illusions without scent components have no effect on them in combat and not much in other conditions. They have +8 on their saving throws vs. illusions without olfactory components under normal circumstances, and +2 on saves vs. those with scent components unless the caster is sufficiently familiar with the scent to duplicate it exactly. An illusion of another troglodyte will not be believed under any circumstances if it is not accompanied by scents proper to the occasion (ie: even a perfectly duplicated battle-scent won't fool a troglodyte during a non-battle oriented encounter). And even the best illusion of a troglodyte is unlikely to be believed for more than a few rounds, as the real troglodyte might eventually begin to wonder why his 'friend' is constantly repeating the same scent phrases over and over again.

7. For those daring enough to use it, here is the spell that Farrand used to trap himself with:

Farrand's Cognitive Conveyance (Necromantic)

Level: 4
Range: 5 feet/level
Components: V,S
Duration: Special
Casting Time: 1 round
Area of Effect: 1 Creature
Saving Throw: Special

Similar to a *magic jar* spell, the cognitive conveyance allows one's mind to enter the body of another creature, but unlike that other spell, it does not remove the original "occupant" from his position. Instead, the caster "shares" the victim's body, seeing through its eyes, hearing through its ears and even thinking with its brain to a certain extent. This effect is put to a number of uses by spies, scouts, and even the simply curious.

The victim of the spell must be within the listed range at the time of casting, and as long as the two bodies are both within the casting range, the caster will be able to see through both sets of eyes at one time, and can control his own body with some minor difficulty. The caster and his host can move any distance away from the caster's body without negative effect, but if separated by more than the spell's range, he loses all sensory or control contact with his own body (which goes into a deep coma but is otherwise unharmed) until such time as the bodies re-enter the spell's range.

The duration of the spell is unlimited, but this is not an unmix blessing. As time goes on, the caster slowly loses touch with his own body and becomes more attuned to the body he "rides in".

Every hour spent sharing another's mind and body removes the caster 5% from his own body, so that he will have lost 25% control of his body's actions after 5 hours, and after 20 hours, he will not have any contact at all with his original body, being fully integrated within his hosts consciousness.

The subject/victim of the spell gets no saving throw to resist it, but in order for the caster to sever the spell and return to his own mind and body, the caster must make a saving throw, rolling the percentage of control he retains of his own body or less to return to normal. Thus, after 5 hours in the hosts mind, the caster must roll 75% or less to return to his own body; after 20 hours he will find himself irrevocably trapped.

If this should happen, the caster will find that he slowly (at a rate of about 1% per hour) gains control of his hosts mind and body. The host will likely have been unaware of the casters intrusion until this point, but if the trapped caster attempts to flex his mental muscle, forcing the shared body into actions the host hadn't intended, there may be a struggle for control, with the caster having to roll the amount of control he has or less to take over the body entirely. If he fails, he loses all control and must begin working at control from 0% again. A patient prisoner will wait over four days (i.e. 100 hours) without attempting a takeover, thus virtually assuring himself victory with a 99% chance of taking over (as a roll of 00 always results in a failure).

If control is established, the hosts mind is not eliminated, it is merely locked securely within the mind of the new controller, and the host-turned-prisoner can begin his own attempts to overthrow the Freeloader, starting at 0% chance, and working his way up 1% an hour until he makes his own attempt at control. The flip-flop cycle of owners can continue until either one gives up, or the caster is finally returned to his own body.

To lose control of your body to an invading mind is a traumatic occurrence. Thus, any time complete control is wrested by one of the two minds, the loser must roll his Wisdom or less on 1d20, or else be driven insane by the shock. If one of the two combatants goes insane, the other gains uncontested control of the body, until such time as the insane mind is restored to sanity.

Once a caster has become trapped in the subject's body, the spell cannot be cancelled by any simple means such as a *dispel magic* spell, and the subjects life force becomes so attached to the host body that it is curiously resistant to even a Magic Jar spell. Those concerned speculate that it would take at least a *limited wish* to free the conjoined minds.

If the caster manages to gain complete control of the body, he can treat the body as his own in all ways; he will be able to cast spells as per normal, and will possess all his own mental facilities, along with the physical capabilities of the body.

enough in the light of day, it seemed difficult to recognize landmarks I had passed but a few days before. I kept forcing my body to look around for familiar sights, while it kept trying to sniff about for smells which might have been familiar to Rose-Boiled Cabbage-Mild Skunk, but which would have provided me no guidance at all even if I had found any.⁸

"Due to the sensory difficulties of the trip, and the fact that my troglodyte body was forced to carry my still-living but mindless and failing human body, the one-day trip to my home ended up taking almost three.

"In my chambers, I pored over the notes I had made during the creation of my *cognitive conveyance* spell and, unfortunately, assured myself of what I had feared most during my week-long ordeal."

Indeed, the smell in the closed theatre had been getting more and more oppressive as Farrand's story went on, and now even the more forgiving members of his audience were starting to take up the hecklers restless muttering. Of a sudden, the lights in the theater lit up, and the scenic illusions that Farrand had been maintaining to his right to show his route to Khanahr faded and disappeared under the lamp's onslaught. But surprisingly, the illusion of the troglodyte that had been standing to Farrand's left for the whole lecture seemed no less solid now than it had before. And Farrand himself seemed oddly awkward as he stood there, moving only occasionally and jerkily as he spoke.

"Since returning from *Roses In Profusion* I have tried every spell I thought would help, but none have shown any promise or effect. When I first entered *Farrand's cognitive conveyance* in

the rolls of this Order's additions to magecraft, some of you warned me about the dangers of employing new magics without proper tests and controlled experimentation. I stand before you now, having delivered my *programmed illusion*, moving and speaking through the use of *telekinesis* and *ventriloquism* spells, to offer all of the profits from my upcoming volumes on the language of the troglodyte to the magebrother or sister among you who can free me from this damned, stinking reptile's body and make me again the man I was!"

Spike Y. Jones would like to thank Kimberly F. Marshall, Dale A. Donovan, Roger E. Moore, and Mark Goldberg for their help at various stages in this article's evolution.

8. Just as troglodyte don't recognize any written form of their language, they don't make use of sketched maps. If a troglodyte is to make a trip into a strange region, another, with past experience of the area, will emit an olfactory sketch of the route, describing the succession of scents that the traveller should encounter along the trip; visual landmarks are only used as a supplement to the olfactory, or when they are obvious enough to be used day or night.

Advanced Dungeons & Dragons®

Fifty realms will wage war across a million square miles of unexplored territory. Join them.

The Ultimate Play-By-Mail Campaign!

Incredible laser graphics. Get detailed maps with each bi-weekly campaign report.

Amazing detail! Face drow and deva, liches and lamia, goblins and gods. Over 600 mapped sites!

Simple to learn. Fun to play. Can you conquer the Savage North? An entire realm is yours to command!

Ask us about our other games also!

Malignant Growth

The Ecology of the Troll

by Paul Leach • illustrated by Monte Moore

Trolls are bestial giants driven by unrelenting hunger, occupying a niche between animal predators and the rest of giantkind. These rubber-skinned brutes prize strength, and they lust for slaughter and destruction, caring little for anything else. Secure in the knowledge that most creatures cannot inflict lasting injuries on them, they fight fearlessly. Despite these characteristics, trolls have the capacity to reason, and they can think beyond their next meal—although when one is at hand, they tend to concentrate on it to the exclusion of everything else.

It's easy to come to the conclusion that trolls aren't much more than regenerating eating machines, but the role they play in your campaign doesn't have to be as simple as that. They can be found skulking about the wilderness alone or in small gangs, but they are also encountered in the service of evil humanoids, giants, or even more powerful monsters. Exceptional trolls that advance in character classes can be encountered as well; most often they are leaders or otherwise special members of a tribe, but they might also be unique NPC enemies or allies.

Trolls in the World

Trolls live in every climate on the surface and inhabit the Underdark as well. They typically operate within a 10-mile radius of their lairs, although those that live in subterranean areas are often more restricted in their excursions.

They are not overly territorial with creatures other than trolls, considering any creature willing to place itself within the reach of their claws and teeth a good thing. They often live semi-nomadic lives, moving on when they have depleted a nearby settlement of all humanoids and domesticated herds, and if wild fish and game are scarce. Unless driven away by powerful enemies, a troll will most likely return to its former haunts when food is plentiful again.

Trolls have no natural enemies, but some monsters prey on trolls like they would any other creature. Only a few of these actually give a troll cause to fear for its life: ankhegs, dragons, oozes, remorhazes, and purple worms. Any creature large enough to swallow a troll (whole or in pieces) and digest it with strong stomach acids encourages caution in a troll. Trolls are fearful of incorporeal undead as well, especially shadows. Most good races seek to kill or drive away trolls whenever they encounter them, as it is a fair assumption the trolls will eat them if given the chance.

A Troll's Life

The natural lifespan of trolls is approximately 100 years, and they reach maturity after just 10 years, although they can hunt and fend for themselves within a year after birth. The young learn mostly by harsh experience, but they are taught to fear fire and to revere only the evil gods

they emulate, namely Vaprak the Destroyer and Erythnul the Many. Trolls grow up nasty and determined, scornful of other races, whom they consider food.

A troll's ability to express itself is often limited to asserting dominance over the weaker members of its tribe through violence, although some like to draw on cave walls or other similar surfaces as a pastime. The drawings (etched in charcoal, blood, clay, or filth) are usually scenes of hunts or wars, and they often contain references to the dark gods the trolls worship. Trolls do not typically engage in crafts of any sort, most of them not even bothering to fashion crude garments for themselves.

Much of their activities focus on acquiring food, whether exploring their habitats for sources of meat, preparing ambushes, or actually tracking prey. These hunters tend to be nocturnal, but they can be active any time of the day. Their scent and darkvision abilities allow them to hunt prey at night, when some of their intended meals might be at a disadvantage. If possible, a hungry troll will attempt to consume a meal on the spot, but it will take food back to its lair if necessary.

Trolls mate irregularly, and their birth rate is low as a result. The courtship ritual is initiated by a dominant female and is often nothing more than a brawl with any competing females to impress prospective mates. Sometimes the female presents her intended with a kill

for them to share (a troll otherwise never shares a meal if it can help it). A mating is most likely to produce offspring when the mother has access to enormous amounts of food, since pregnant trolls become even more hungry and vicious. The year-long gestation rarely results in more than one troll newborn.

Wealth

Trolls do not normally learn a craft, nor do they engage in commerce or till the soil as a way of life. They collect treasure, usually by theft or plunder, but sometimes they earn it. They don't view coins as a means to acquire material comforts and goods, but as something to measure their power and worth. Trolls love magic items, and they are considered more valuable than platinum coins when it comes to measuring one's worth, especially if the item can be used as a powerful weapon to intimidate other trolls.

Society

Troll society is limited to small clans or even single families, as they are too

chaotic and violent to sustain order in a larger group. Small family groups allow for manageable hunting parties and provide some kind of mutual protection for the individual members. As females are stronger than males, most clans are matriarchal.

Inter-tribal relations are normally limited to random meetings to share news or to trade males or valuable magic items. In other societies, family members are ritualistically given to other families in formal fosterage or marriage alliances. Most clans do not trespass on another clan's territory unless spoiling for a fight. Temporary agreements can be reached when fighting a common enemy or if there is plenty of humanoid prey to go around.

Troll culture and history is maintained through oral tradition. Each clan attributes a divine origin to its founder, with its Great Mother often being a daughter of Vaprak. They believe themselves superior to the other giant races because they have maintained their connection to the primal, chaotic forces of the earth by emulating its ability to destroy and regenerate.

Several giant mythologies acknowledge elder creator gods, many of whom are no longer actively worshiped. The trolls are no different, and their legends speak of a dark Earth Mother.

Lairs

Troll dens are often a series of two to four connected natural caverns. They do little to improve the living conditions in their caves, although they might conceal or bar the entrance to their lairs. They generally look for caves that have small mouths (about 5 ft. x 5 ft.) and narrow, winding entry tunnels.

Trolls typically disguise the entrance to their lairs with large boulders or a pile of earth and brush. Trolls like dens that offer strewn boulders or stalactites and stalagmites, as they can use these to set ambushes, and the tribal adept can fling spells while protected by their cover.

Trolls prefer caves that have two entrances, especially if they allow the trolls to leave by one and easily return by the other. Such a troll den presents a greater threat to adventurers, since they might find themselves quickly cut off from escape once a troll circles

around behind them. The second entrance to a troll's lair is usually a natural crevice or shaft, as it can also serve as a trap to unwary adventurers. A troll can turn the shaft into a trap simply by not disguising its tracks when returning from hunting and then making sure its trail leads over the brush-covered hole. The trap can be made more dangerous by setting wooden spikes or even a *glyph of warding* on the cave floor.

Killer Creature Combos

Trolls are often found in the company of other creatures, either serving as henchmen and servants or as partners.

Troll and a Trap: Trolls aren't particularly concerned with falling damage, so they are often willing to grapple a PC and take the foe over the edge of a pit or cliff. A single troll and a 60-foot-deep pit trap is an EL 6 encounter.

Troll and Troglodytes: A troll can add some extra muscle to a troglodyte encounter. With the troll's good Fortitude saving throw, it's not likely to succumb to their stench. Although these two species don't normally associate with one other, the drow often employ both races, giving them cause to work together. This group might be found in drow service, or they might simply be veterans who have left the drow but continue to work together. A troll and six troglodytes make for an EL 7 encounter.

Ogre Mage and Trolls: An ogre mage might use trolls to soften up its opponents while it remains invisible, waiting for an opportune moment to cast *cone of cold* into the melee (the trolls don't like this, but they can regenerate the damage). If the PCs easily resist the trolls' attacks, the ogre mage makes its cold attack before the trolls take too much damage. Otherwise, it waits until the PCs are thoroughly weakened before it frosts them and charges into melee. An ogre mage and three trolls is an EL 10 encounter.

Drow Wizard and Trolls: An 8th-level drow wizard could support her troll servants (four regular trolls and one 4th-level troll rogue) in combat by keeping the PCs occupied with her strong defensive position while she sets them up for an ambush. Surrounding herself with her regular trolls, she casts *minor globe of invulnerability* to protect

them from magical fire attacks and mind-controlling spells. She casts *fly* and *improved invisibility* on the troll rogue so that it can deliver sneak attacks to the PC spellcasters. The wizard further assists her trolls with such spells as *bull's strength*, *haste*, or *protection from elements*. This is an EL 12 encounter.

Fire Giant Cleric and Trolls: A 5th-level fire giant cleric might deploy his troll slave guards (six regular trolls with a 7th-level barbarian leader) against the PCs. He uses *protection from elements* to ward himself against cold-based attacks, and he casts *resist elements* on the troll barbarian to help against fire-based attacks. The remaining trolls simply work to distract the party and help the giant and the barbarian make flanking attacks. This is an EL 16 encounter.

Vs. PCs

Troll combat tactics revolve around their multiple attacks, regeneration ability, and their hunger. They rarely use weapons, as their natural attacks are comparable, if not superior, to most weapon damage. The exception is a troll that has received special training and taken a level in a character class, or if the weapon is magical and particularly powerful. Trolls typically don't have a reason to hang back from a melee unless prevented from closing by fire or other powerful barriers.

The information below describes how best to use a troll's abilities and tactics, and is intended to help a DM run a troll NPC. Players should skip this section and instead read the Vs. Trolls section later in this article for information on battling trolls.

Entrapment: Trolls like to set ambushes if the terrain allows, attempting to herd prey into a dead end or over a deep pit. This tactic is most often used in their cave lairs and is easily accomplished by overrunning the PCs and cutting off their only means of escape. When hunting humanoids in the wilderness, trolls might be patient enough to wait until

HALF-FIEND/HALF-TROLL

their prey reaches difficult or impassable terrain, such as rivers, thick brush, or canyons. When the trolls' patience runs out, if they get too hungry, or if they suspect they have been detected by their prey, they give up on the ambush and simply charge.

Into the Fray: The overrun tactic mentioned above has other uses, as it is a good way to reach enemy spellcasters who use magical fire. Most trolls are not concerned about provoking attacks of opportunity when they charge the front rank of warriors. As trolls have extended reach, they can also do some damage to PCs who hope to gain protection behind the group's fighters.

Bring 'Em Down: After charging in to reach its prey, a troll usually attempts to grapple it. With the troll's high Strength, it's likely that the troll will succeed. It can then use its natural attacks with grapple checks, following up with its rend ability.

To Each His Own: There is little cooperation among trolls, each being concerned with feeding itself. Trolls rarely give aid to their allies unless they are following the commands of a fearsome leader.

Trolls With Class

There are some trolls who stand out above the others in brute strength, intelligence, or determination. These trolls seek specialized training and advance in character classes. While a troll can take a level in any class, assuming it meets the alignment and ability requirements, trolls generally only train as barbarians, clerics,

ROCK TROLL

fighters, and rogues. Below are suggestions and tactics for NPC trolls that have levels in these classes.

Barbarian: This class is well suited to trolls, the ability to rage and quickly pursue fleeing opponents at 1st level makes these monsters more menacing than usual. For their feats, troll barbarians tend to take Combat Reflexes, Improved Initiative, Power Attack, Run, and Weapon Focus (claw). Climb, Swim, and Wilderness Lore are the best skills for a troll barbarian, as they allow the creature to better navigate natural obstacles between it and its prey.

Cleric: Only exceptional trolls take a level in this class, mainly because of the high Wisdom required to cast even the weakest divine spells. Most clerics are leaders of their small tribes. Their spellcasting abilities offer them more flexibility than the battle tactics used by

most trolls, but like other trolls, they eagerly jump into melee combat as soon as possible. They cast protective spells on themselves before combat and then proceed to attack enemy spellcasters or exceptionally dangerous fighters with offensive spells. Once they have exhausted their repertoire (it's possible a troll might withhold a spell or two), they make melee attacks. Clever clerics who've encountered adventurers before

might employ special tricks, such as using the ready action to cast *shatter* on the first PC to pull out a flask of alchemist's fire, causing the PC to suffer a direct hit when the flask explodes in his hands. The PC's problems are compounded if he carries other flasks, as they are subject to the spell's radius. Trolls with access to *summon monster III* are likely to bring a water elemental to the fight, giving some measure of control over PC pyrotechnics. Troll clerics often cast *hold person* on fighters and other strong melee-minded opponents, but some trolls attempt to use this spell against spellcasters, hoping to overcome a good Will save for a very dramatic success. Troll clerics do not worry about missing any early kills, as they have sufficient power to force lesser trolls to give up a meal.

Troll clerics favor the Combat Casting feat, but they've also been known to take the Brew Potion and Empower Spell feats, along with any of the feats commonly taken by troll barbarians. They allot most of their skill points to Concentration but occasionally take ranks in Knowledge (religion) and Spellcraft.

Trolls prefer spells that protect them from fire and acid, enhance their combat abilities, and harm enemies. Outside of their ability to rebuke undead, troll clerics do not care much for spells that combat or create undead; they don't hunt undead for food, and they don't leave much of their victims to animate. Many troll clerics worship either Erythnul or Vaprak, allowing them

access to domains that support bloodletting, with most choosing Evil and War (Erythnul's clerics) or Destruction and Strength (Vaprak's clerics). Like PC clerics, trolls might choose to worship religious concepts, but care should be taken in allowing domain choices to favor game advantages over good roleplaying. For instance, the Water domain is appropriate for scraggs (aquatic trolls), but to give it to a land troll seems only like a way to give it the ability to rebuke fire creatures.

Listed below are common spell choices for a troll cleric of up to 5th level.

0: *inflict minor wounds, resistance*;
1st: *bane, bless, divine favor, doom, endure elements, magic stone, protection from good, shield of faith, summon monster I*; 2nd: *bull's strength, darkness, endurance, hold person, inflict moderate wounds, resist elements, shatter, summon monster II*; 3rd: *deeper darkness, dispel magic, glyph of warding, inflict serious wounds, prayer, protection from elements, stone shape, summon monster III*.

Fighter: This class is not as popular with trolls as the barbarian class, but its disciplined style appeals to trolls that serve as mercenaries to hobgoblins and fire giants. Troll fighters take many of the same feats as troll barbarians, but especially Power Attack, Cleave, and Great Cleave. Many also take the Weapon Specialization (claw) feat. Troll fighters spend their skill points on Climb, Jump, and Swim, rarely taking ranks in any other skill.

Rogue: The ability to make sneak attacks and evade *fireballs* comes in handy. A troll rogue usually spends most of its skill points on the Hide and Move Silently skills, and a few clever rogues use the Craft (trapmaking) skill to set traps in their lairs for unwary adventurers.

PC Trolls

This is not an easy race to integrate into a campaign, especially if most of the PCs are from the standard races listed in the *Player's Handbook*. Since they have an ECL of 11, the PC troll should be introduced only when the other characters are of similar level. A PC troll shouldn't be restricted to the chaotic evil alignment, but even a good troll will be viewed with suspicion and hatred by most civilized folk. Trolls are not socially acceptable except in the

VAPRAK THE DESTROYER

Vaprak is the chaotic evil patron deity of trolls and ogres, and he embodies the strength and ferocity that both races find appealing. Other giants worship him as well, especially brutish ettins and hill giants. The Destroyer appears as an extremely large troll (about 15 feet tall) and his claws are stained with the blood of those he has slaughtered. Vaprak is worshiped in caves and where the enemies of his followers are killed and eaten. His clerics have access to the domains of Chaos, Destruction, Evil, and Strength. The claws is his favored weapon.

roughest of company, such as mercenary or adventurer bands. If traveling alone, a troll PC should expect to be driven from town.

A troll might take a chance outside of barbarian lands to amass wealth, fame, and power to enable it to better control its savage kin when it decides to go back home (not unlike some half-orcs). A small kingdom bordering monster-inhabited lands could be a source of employment, offering coins and cattle to gain a mercenary who is intimately familiar with the kingdom's enemies. As another possibility, the troll might join the PCs in a quest against a common enemy.

Vs. Trolls

Trolls rarely show restraint when given the opportunity to eat humanoids. Adventurers willing to go on troll hunts often find themselves as the quarry. With luck, the right armory of spells and weapons, and some good strategic planning, your adventuring company can defeat these monsters, or at least escape with their lives.

Preparation

Although fire and acid are what ultimately destroy a troll, every member of an adventuring party can contribute to the demise of this bloodthirsty, regenerating foe.

Fire spells: *Fireball* is an excellent choice to use against trolls, but there are other fire-based spells to employ against these brutes. Area effect spells are best, such as *acid fog*, *fire storm*, and *flame strike*. If these spells aren't available, cast *web*. Once the troll is trapped by the spell, any member of the party can quickly set the creature on fire with a simple torch. *Flaming sphere* is useful for impeding trolls, and *fire shield* and *wall of fire* might keep them at bay, or at the very least, do some damage to them if they can't be swayed from charging in to eat your PC. *Fire seeds* and *glyph of warding* (set for fire damage) are useful to cover a retreat or set an ambush, as is *fire trap* if there is a door between you and the trolls. Don't forget *burning hands*, *flame arrow*, or *flame blade*. The Empower Spell feat improves these damaging spells. Since trolls don't have great Reflex saves (only +4), they will take the heat most of the time.

Other spells: Trolls have poor Will saves but great Fortitude saves, so take advantage of spells that require Will saves. Some that are useful for incapacitating or driving away trolls include: *charm monster*, *fear*, *hold monster*, *sleep*, *slow*, and *suggestion*. *Command* and *color spray* are good for only a short while, but they are still handy at times. Surprisingly, *bestow curse* might be the best spell for

knocking out trolls; with their low Intelligence and Charisma scores (typically a 6 for both abilities), a failed save drops a troll to 0 points in either ability, putting the monster in a "comalike stupor," (see the *DUNGEON MASTER'S Guide*). Used cleverly, an illusion can save the day by drawing the trolls away from the party or into a trap, but don't forget that they have the scent ability or your illusion might be useless.

Melee: When fighting a troll, it is important to have feats and weapons that cause a lot of damage, otherwise it's almost impossible to keep up with the troll's regeneration ability. The Power Attack feat is a must, and Weapon Specialization, with its additional +2 to damage, is useful for fighters. Greatswords and greataxes are ideal for close combat, but don't underestimate longswords and polearms, which are useful for their reach capabilities. Preventing just one of the troll's claw attacks from hitting can save a character from the troll's deadly rend attack, so good armor or magic protection is paramount. Dwarf and gnome fighters get a +4 Dodge bonus against giants and should have a healthy number of hit points to boot, making them ideal companions to have around when hunting trolls.

Ranged Attacks: Most normal missile attacks are worthless against trolls unless they are followed by some of the more powerful tactics and attacks listed above; it does no good to rely on only shooting a handful of arrows at a troll, because before you can do more damage on your next turn, the troll has

FIENDISH TROLL

most likely regenerated and is back to its normal hit point total. Flasks of alchemist's fire and acid are noteworthy exceptions to this guideline, despite their short range. Tanglefoot bags can be useful as well.

Coup de Grace: Be sure to save some fire and acid for coup de grace actions on fallen trolls. Only an attack that deals normal damage to a troll (fire and acid) can be used for a coup de grace.

Tactics

Once you find some trolls, or they find you (as is most often the case), the encounter will likely continue until the trolls are completely wiped out or flee when they come to the conclusion they are truly outmatched and you can destroy them. Don't expect parley attempts to bring much success unless you back it up with magical mind control or obvious raw power.

Fire Away: Use long-range fire attacks on any trolls you encounter. This causes them normal damage not subject to their regeneration ability. If you cannot blast them with high-damage, area-effect spells, consider concentrating weak fire attacks against one or two trolls instead of trying to reach the entire gang. Area effect spells are most efficient when the trolls are squeezed into confined tunnels and dungeon halls.

Within Claw's Reach: It's wise to take advantage of ranged fire attacks when fighting trolls, but don't be afraid to put tough fighters right next to them. Fighters should be backed up with a second rank of characters who have

SLIME TROLL

it is possible to surround a troll, do so unless it opens you up to flank attacks. If you have no other choice but to let the fighting front ranks administer a torch or acid coup de grace, sacrifice the next melee attack and chance an attack of opportunity from the next troll; if the downed troll regenerates back to 1 hp, he inflicts as much damage as the fresh troll.

Attack, Evade, or Feign Retreat: If your

party can reduce the trolls' ranks or at least a lot of their hit points with ranged attacks, consider charging the trolls while they are weakened. If you need to fall back due to losses or you want to

trick your enemy and feign retreat, spellcasters can make things unpleasant for pursuing trolls by using the *glyph of warding* and *fire seed* spells. This is a good time to counter attack if the trolls are sufficiently damaged, even if you do intend to run again.

Defensible Positions: Don't let the trolls push you into a dead end or surround you. Once they've managed to do so, you have no choice but to fight your way through them. If a troll manages to get in close to your spellcasters while others are attacking your fighters, your spellcasters might have no other choice but to hit the nearby troll with melee weapons or magic spells that hit only one target. Meanwhile, the other trolls don't have to face the attacks of your spellcasters while they chew up the fighters. This is a good time for the rogue to make some flank attacks; it should be the rogue's responsibility to provide security for the spellcasters.

reach weapons and spells. Be sure to save the alchemist's fire for desperate situations: Unless your melee combatants have hit points to spare, they'll want to avoid splash damage. If

THE SAVAGE CLAW

The savage claw (cleric/barbarian) is a religious devotee who revels in divinely inspired rages. A savage claw worships either Vaprak or Erythnul, assuming the title of Savage Claw of the Destroyer or Savage Claw of the Slayer, respectively. A savage claw is often the leader of his tribe and sometimes has enough power to rule several tribes of trolls and ogres, at least for a limited time.

At lower levels, the savage claw spends more time focusing on his cleric levels, although he does take a level of barbarian early in his training. This progression allows him to gain spells quickly and improve his weak Will save while still gaining the ability to rage. As the savage claw advances, he follows a more even progression of training, alternating between the cleric and barbarian classes. This progression works well since most trolls do not have the necessary Wisdom scores to take full advantage of the more powerful cleric spells.

Savage claws usually begin combat by placing protection spells upon themselves or targeting enemy spellcasters with offensive spells. They then fly into a rage and hurl themselves into melee.

SAVAGE CLAW STRENGTHS AND WEAKNESSES

(Compared to the single-classed barbarian)

Advantages

Ability to cast spells

Better Will saves

Disadvantages

Fewer hit points (this is not a big disadvantage considering a troll's starting HD, Constitution bonus, and regeneration ability)

Can't rage as often

Does not gain access to barbarian's higher-level abilities

SAVAGE CLAW ADVANCEMENT

Troll

“I have removed and stored so much of my captured troll that I have enough pieces to make ten, yet still I find myself stymied. Every bit of skin, every organ, every tissue, removed and regrown, to no useful result. For weeks I’ve tried to create a new one out of severed parts, a wholly unique second troll, but the experiment yields only a lifeless mimic of my patient.

“What subtle factor is missing? Where is the divine spark that separates a cold husk from a living creature?

“A wonder of the gods, these trolls. Terrible, but fascinating.”

—The journal of Dr. Bensí Skule

The trolls of myth lurk under bridges to grab unwary passersby and feast on their flesh, then skitter into dark caves before the first rays of sunlight make their skin solid as stone. As with most myths, these are based on several facts regarding real trolls and their cousin species.

Overview

Although the relationship remains long forgotten to all but the most learned scholars, trolls are distant cousins of hill giants. Their regenerative abilities long ago set them apart from their dim-witted relatives, and their tendency toward a solitary lifestyle drove them deeper into the wilds to seek larger and more lucrative hunting grounds. Male trolls see themselves as predators at the highest rung of the evolutionary ladder and rule their hunting grounds with unquestioning violence. Female trolls see themselves as protectors, brutally responding to any perceived threat to their young.

Trolls are a complex race with a well-established social order and a kind, even caring system for raising their young. This dichotomy of violence and nurturing seems

alien to humans, who see trolls as nothing more than unstoppable monsters. Female trolls gather together in wandering groups that rarely stop for more than a few days at one location. Females raise the younglings, teach them to fight and hunt, and prepare them for adult life. Males are solitary creatures, afflicted with wanderlust once they reach adulthood. If a male resists his instinct to roam, the female trolls forcefully eject him from the group, sometimes killing him if he aggressively refuses to leave. This is done to protect the younglings—a troll male is the ultimate hunter and kills and eats even his own children as easily as he does a deer.

It's these wanderlust-afflicted males, near starvation and unable to find a suitable hunting ground, that stumble into remote farmsteads or attack sparsely populated rural communities and spur myths of terrifying trolls that come in the night. These encounters between civilized humanoid societies and trolls are rare, but when they occur, they feed fear and hatred in the hearts of civilized men.

Ecology

Trolls are large, lumbering giants that stand taller than men, although their hunched posture tends to make them appear smaller. When provoked to combat, they launch upright, puffing up their chests, stretching out their huge arms and bellow ear-piercing challenges. Trolls are quick to aggression, fearsome in a fight, and able to move faster than their size suggests. One moment, they slouch along a forest path, and in the next they are smashing through trees, their hooked snouts filled with the smell of their prey's fear.

A typical male troll weighs 300 pounds and stands 8 feet tall when fully upright. A female troll is much larger and much more dangerous. Females can weigh as much as 500 pounds and have been reported as tall as 10 to 12 feet. Female trolls are just as fast and strong as the males, but their size adds a whole new level of terror when one crashes out of the tree line. Males and females have slight physical differences outside of height and weight. Both sexes typically possess green skin, but males tend toward lighter green to yellow variations, whereas females have deep jade to almost jet-black skin. Males have smaller eyes, heavily lidded beneath thick brows, with crisp facial features and small mops of weed-like hair atop their heads. Females have large, bulging eyes, softer-featured faces, and thick, dark hair stretching to their shoulders.

Regeneration sets trolls apart from other giants. Where their larger cousins developed cautious demeanors, as their sheer size in relation to the world around them is often a source of injury or death, trolls fear nothing. If a troll falls off a cliff, its mangled and broken body eventually restores itself. If a troll attacks an armed explorer wandering through its territory and the explorer cuts the troll's arm

off, the severed limb either grows back or the troll simply picks it up off the ground and reattaches it. This boon instills a great deal of confidence in trolls—a confidence that defines them both as individuals and a social group. They've moved farther into the wilds than most of their cousins, fearing none of the monsters and horrors that exist in the dark places of the world.

There are two phases in a troll's natural development: youngling and adult. As younglings, male and female trolls learn to hunt and fight together. Upon maturity, though, everything changes. Female trolls reach their child-bearing maturity around age 12. Newly matured females give off a scent that adult males can smell up to 50 miles away. This causes every adult male that picks up the scent to immediately leave its hunting grounds and seek the cause of its sudden mating instinct. Males trickle in and follow the female groups from a distance—if they stray too close without proving their dominance, the females viciously attack and chase off all potential suitors. Since males spend their entire adult lives as solitary hunters, it's no wonder that these gatherings of males often lead to the ripping apart of several males before one proves worthy of breeding. After a time, the strongest male is allowed into the female group to breed. Once the event is over, however, the male must flee or face terrible pain and possible death. Adult males attack and eat troll younglings, which is why female groups eject them when the males reach full maturity at around age 15. The instinct to protect their younglings is strong in troll females. They are quite aware that trolls can be burned, starved, drowned, and destroyed, and they have perfected the use of these methods in defense of their family units.

Females breed only once and give birth to sets of younglings—typically two to three, although sometimes as many as five. A newborn troll weighs around 50 pounds and stands about 3 feet tall. They can walk immediately at birth and their instincts to kill and hunt are strong from day one. Stories of small trolls attacking livestock in outlying communities are laughed off as tall tales, but it's entirely plausible that a newborn troll might wander from the main group to seek food on its own.

Habitat & Society

From birth, trolls of both genders are raised by the females. The mothers and sisters of troll social groups form simple, multi-family hunter-gatherer bands that wander the primeval forests and high mountains far from civilization. Young trolls are taught to hunt and survive in the wild and are subjected to daily attacks by their peers and elders. It's completely normal for a youngling to find himself ambushed by others of his group and to have to claw and bite his way to freedom. Weakness has no place in these troll groups and as nurturing and kind as the troll mothers

ROCK TROLLS

Many have attempted to experiment on trolls over the years, and the rock troll is one of the few successful strains. Rock trolls are much larger than their brothers, their bodies having been fused with flecks of granite, shards of diamonds, and veins of iron. Their blood was replaced with an alchemical solution that enhanced their regenerative powers, their skin hardened like steel, and their speed increased with secret blood magic. The alchemical solution in their blood had a dire side effect, though: during the day, it reacted to sunlight and sent a toxic hormone flowing through the veins of the rock trolls. After a few minutes beneath the burning sun, the creatures slow and eventually stop, descending into hallucinatory trances. As the shade of evening approaches, and the light of the sky dims, the hormone production stops and rock trolls can move again. Rock trolls frequently subjected to multiple days of this stupor eventually permanently turn to stone.

Since their creation, rock trolls have been ruthlessly hunted and destroyed. Because of their long life and regenerative properties, they rarely feel the urge to breed, and most believe their extinction is imminent.

are to their children, a deformed or weak youngling is destroyed without a glimmer of remorse.

This violent troll lifestyle has resulted in an interesting culling behavior. Weakness is feared in both male and female trolls and once signs of it are apparent (an older female who can't hunt, for example) the group immediately abandons or even kills the failing member. Because of this, trolls rarely grow to what scholars would consider old age—generally, trolls live to be about 40 years old. Trolls are still subject to some of the risks that humans are: they can be killed by viruses that inhibit their regenerative abilities, and drowning, fire, and acid put an end to trolls in quick order. Starvation can also end a troll's life. A full-grown adult troll needs up to half its body weight in food every day. After only a few days without sufficient food, a troll's regenerative abilities cease to function. Once it loses its regeneration, a troll quickly succumbs to starvation or other natural hazards. Troll family groups sometimes bind weak trolls, dump them into pits, and leave them to starve to death. More often, a weak or ill troll is simply drowned.

Male trolls prefer caves or thick, dark wooded glens for their homes. Sometimes they build crude structures out of salvaged wood and metal, and they even occasionally build

their ramshackle hovels beneath bridges or overhanging cliff ledges. These domiciles serve only as bases to which the males can return with captured prey to consume away from the elements. Female trolls sometimes drag around captured tents or pull carts filled with wood to use for building rough structures to house the younglings. Trolls can survive any weather thrown at them, but they find several days of sleeping on the ground while hail, snow, and rain pound away on their flesh to be uncomfortable, and they prefer shelter in which they can escape the weather.

Trolls believe that a greater demon named Urxehl created the world and populated it with them. Urxehl is a cruel god, though, and troll faith is based on the premise that he incessantly infests their hunting grounds with ogres and trespassing humans, pounds them with seasonal storms, or tears through their hunting grounds with roaring forest fires (forest fires, of course, being the one thing trolls fear). Even more frightening is the troll belief that Urxehl gave them their powers of regeneration so they might survive his trials and live on to be brutalized again and again.

Games and activities that humans would call fun are not something trolls take time to consider. They are consumed with the need to hunt, leaving little time for other diversions. Troll female groups have one game (of sorts) that they play every spring solstice to honor their terrible demon god. Two lines of

trolls form several yards apart and stare at each other, working up their aggression and hatred until their "team" is a mass of frenzied berserker rage. The team mentality ends the moment one of the trolls breaks his or her line and charges at the other one. There seems to be no obvious starting point—a troll simply feels her rage wash over her and throws herself at the other group. The result is chaotic troll melee where limbs are severed, bodies torn apart, and eyes gouged out—even some rage-induced cannibalism occurs. When it's over, one troll stands less injured than the others, all of whom lay strewn about the battlefield crawling toward severed limbs or gathering their entrails and stuffing them back inside their punctured bellies. Once everyone has recovered, they quietly go about their business.

Trolls rarely interact with other species. Females are known to trade captured equipment and gold to gnolls in exchange for their slaves (which the trolls eat), and troll tribes have allied with ettins and hill giants to protect their hunting grounds. Individual males sometimes hire

themselves out to gnoll bands as guards and enforcers in exchange for food. These are exceptions, though—odd occurrences that stray outside the troll norm. Although trolls see any creatures invading their territories as threats, they see ogres doubly so. A lone ogre wandering through a male troll's hunting ground or crossing the path of a female group is a sign of impending disaster—for the ogre. Ogres are stupid brutes, prone to play with their food and kill it for sport just as often as to eat it. Large ogre tribes can eradicate an entire region's food supply, causing starvation and extinction for resident trolls. Trolls have learned over centuries to immediately destroy ogres and their outposts whenever discovered. Males repeatedly attack ogre enclaves, wandering off when wounded, only to return immediately after regeneration to attack again. Ogres lack the intelligence to effectively fight a troll assault, and even a single troll can seem like hundreds when it flees a bloody mess and comes back 10 minutes later fully recovered. Ogres scare their children with tales of massive troll armies waiting to destroy ogrekind—and if trolls had armies they would gladly fulfill those nightmares.

Campaign Role

A solitary male troll brutally protecting his territory always makes for a good wandering monster encounter. Since males seek stable hunting grounds, they can be found in cave networks, dungeon complexes, forests, low mountain foothills, and anywhere large numbers of other creatures live. These encounters should always be frightening—a male troll feels no fear, after all, and should immediately plunge into the party and tear PCs limb from limb.

Young males, freshly ejected from their childhood wandering groups, can also make for interesting encounters in rural villages or along caravan routes. The young male encountered thusly is likely near death from starvation and desperate for food. A starved troll doesn't have full use of its regenerative abilities, so this can serve as an encounter 1 CR lower than the standard troll—a horrific sneak peek at what fighting a troll is like.

Female trolls and their family groups can be the basis for an entire adventure. The PCs could be hired by village elders to find a particularly troublesome group and either convince them to relocate (not likely) or simply destroy them all (a difficult task). These groups can also make for fun high-level encounters, as the PCs have to fight back wave after wave of adult females and younglings that find the PCs threatening.

Treasure

Troll males never intentionally collect treasure. They exist only to hunt, but do tend to drag their victims back to their lairs for consumption. A vanquished male most likely has a trash heap somewhere near his lair, full of battered armor,

THE TROLL OF ABSALOM

Some 20 years ago, Dr. Bensi Skule—an alchemist from Absalom—traveled far into the northern reaches of Avistan in search of plants, minerals, and creatures upon which to continue his bizarre experiments. Near the Worldwound, his party came upon a scorched troll camp and found a newborn troll male near death from starvation. Dr. Skule was elated—the opportunity to experiment on a creature with such regenerative powers could provide the great discovery he was searching for. He nursed the youngling back to health and returned to his Absalom lab to begin his experiments. The young troll grew into a large, adult male troll whose only life experiences involved being dismembered, slashed, bled, operated on, and generally mistreated. When Dr. Skule was murdered for his massive debts, the troll science project did the only thing he knew: he became Dr. Skule and continued experimenting on himself. Fearing that he would be destroyed if caught wandering the streets of Absalom, the new Dr. Skule hired a force of street urchins and runaways to run errands for him and gather information. He continues his captors' experiments, hunched over complex alchemical machinery, surrounded by shelves full of his preserved limbs, organs, and skin tissue. The urchins call themselves Skule's Army and have turned into a complex underground network of information brokers. The new Dr. Skule, although hidden, is the heart of this network and uses the sale of key bits of rumor and speculation to fund his obsessive research into the source of his natural abilities.

weapons, and gear mixed with bones and sinew. The longer the troll has lived there, the more likely he's killed someone carrying items of value and has unknowingly tossed this treasure into the trash. Troll males do collect ogre skulls as trophies and wear them when attempting to woo females.

Female trolls tend to be a little more intelligent than the males and keep gold, armor, and weapons for trade. In a typical female traveling group, there are two or three bags of items taken from raids the females use to trade for slaves or tools. The chance of finding a rare magic item is always greater with female groups, as they might actually wear some of the shiny things found on their victims, not knowing the items' real value or purpose.

Variant Trolls

The natural healing powers of trolls, combined with their long history, has led to a number of different breeds, some of which are summarized here.

Moss Trolls: In the deepest equatorial jungles of Golarion exists an ancient cousin of the modern troll, long thought extinct. Called moss trolls, these precursors are more plant than giant. They stand barely taller than a

TROLL AUGURS

The trolls of Golarion worship a greater demon named Urxehl, a being they believe created trolls and placed them on Golarion to live out lives filled with pain and suffering. Tragically, Urxehl gave trolls their regenerative abilities so they could survive Urxehl's trials and live on in suffering worship of their demon god. Occasionally, Urxehl rewards his followers by granting a troll the Gift of Sight. Called augurs, these trolls gather together and work out of rogue settlements like Kaer Maga or the Vile Fortress in eastern Vudra. They slash open their own abdomens and wrench out their entrails to read the future in the quivering innards. There are rumors that troll augurs are immune to fire and acid, although no one has yet put those rumors to the test.

GIFT OF SIGHT

Sometimes trolls are granted limited powers of divination by their demon god, Urxehl.

Prerequisites: Troll, patron deity Urxehl.

Benefit: You can read the future by cutting open your abdomen and pulling out your entrails. This is a full-round action that deals 6d6 points of damage to you. This functions as the *divination* spell, using your Hit Dice as the caster level. You can perform this ability no more than once per day.

human and weigh around 100 pounds. Thin, branch-like arms stretch the length of their body and end in curved, wicked claws that sprout from their fingertips like thorns. Their bodies resemble a humanoid shape of green jungle foliage and their eyes are hidden beneath a heavy brow and thick, bushy green eyebrows.

Moss trolls live in pods numbering as few as six to as many as 100. Long ago, their pods roamed the world's temperate and tropical forests and jungles and dominated the food chains there. Now, their numbers have dwindled, and they've become prey to larger, faster denizens of the humid rainforests of Golarion.

These bipedal plants exhibit similar traits to trolls: they regenerate wounds, they use their claws to deliver terrifying rend wounds during combat, and they know no fear. They also have a few key differences: they're smaller and their bite delivers a debilitating poison that attacks the nervous system (Fortitude DC 15; initial 1d6 Dex and secondary 1d6 Dex).

Scrag: Scrag dwell their entire lives in freshwater aquatic environments such as lakes, rivers, and stagnant ponds. They're only vaguely related to trolls, bound in myth by the similar regenerative properties of both races. Scrag are air-breathers, more like frogs than humans (or even trolls), and their regenerative abilities only work when fully submerged in water. Scrag become increasingly uncomfortable the longer they stay

dry, and after a few days outside of their habitat, they become sluggish and confused, eventually dying if not fully submerged or doused in water again. This limitation has kept scrag from becoming a larger species, and as a result it's rare to even see a scrag in the wild. Scrag are thieves, obsessively collecting shiny objects to store beneath the surface of their home lake or river, and they often attack passing caravans or unwary fishermen if they see something desired for their collection. Thin, hunched creatures that vaguely resemble their troll cousins, scrag differ in that their skin is slippery green and their backs possess long rows of sharp, defensive spines that start at the base of their necks and bristle down to their lower backs.

Trolls in Golarion

Wandering bands of troll females can be found throughout the continent of Avistan. They tend to stay away from civilization and are usually found in the wilds north of the River Kingdoms, in and around the Menador Mountains, across the Storval Plateau in Varisia, or roaming the mountains and forests in the northern kingdoms. These regions also have thousands of individual troll males who have staked out hunting grounds ranging in size from a few miles in Varisia to hundreds of miles in the lands north of the River Kingdoms.

In southern Vudra, far to the east of Avistan, lives the largest tribe of trolls on Golarion. Called the Mistshaper Trolls by locals, these trolls are ruled by a huge troll female named Xelnud. Xelnud is 2 feet taller than any of her tribe and weighs nearly twice that of the next largest troll. It's rumored among her followers (quietly—as it is best not to anger Xelnud) that she entered into a pact with Urxehl and became his lover in exchange for her mutated size and stature. Xelnud's style of leadership brooks no discussion and no disloyalty, and she tortures and ritually starves any troll stupid enough to oppose her. Her viciousness and fanatical devotion to Urxehl has led her to believe that she's the demon god's agent on earth. She plans to gather together all the trolls of the world to destroy civilization and restore Golarion to a dark, brutal state like it was during the Age of Darkness. Although this task is impossible, her delusions of grandeur might have dire consequences for the people of Vudra and the surrounding nations.

Names

Troll names are typically simple combinations or corruptions of their parents' names.

Male: Alrekr, Brokk, Durtl, Gulurd, Hakon, Havart, Lunt, Odell, Odurx, Prek, Sigurx, Tarll, Urx, Volurd, Wekk

Female: Asta, Berg, Delli, Eydis, Halsan, Invarr, Kelda, Onun, Terghel, Unni, Urtha, Volhel, Volu, Xel, Xelnud

TROLL

Lumbering out of the trees is, upon first impression, an enormous human with broad, thick shoulders and two solid, tree-trunk arms stretching down to almost drag on the ground. At further glance, its skin is a sickly, greenish hue and its eyes are pools of inky blackness. Its face is long and angular, with a solid, pointy chin and a crooked, hawkish nose, and its hair looks more like a mat of forest weeds and rests tangled and greasy on its heavy brow. There is an air of unsettled violence about it—its hands end in razor-sharp claws and its body seems taut and agile despite its size.

We've all heard troll stories—"Argo and the Troll," "Droan o' the Bogs," "The Brambleman"—but they're more than just old yarns, they're lessons. Everyone ends the same way, in acid or in fire. Acid and fire. Don't forget it. It might just save your life.

TROLL

SPECIAL ABILITIES

Regeneration (Ex) Fire and acid deal normal damage to a troll. If a troll loses a limb or body part, the lost portion regrows in 3d6 minutes. The creature can reattach the severed member instantly by holding it to the stump.

Rend (Ex) If a troll hits with both claw attacks, it latches onto the opponent's body and tears the flesh. This attack automatically deals an additional 2d6+9 points of damage.

The Ecology of the Umber Hulk

A three-quarter-ton rock drill with a bad temper

by Tony Jones

The following was taken from Creatures of the Earth's Deeps, *by the sage and wizard Archmyel:*

The umber hulk is one of the more powerful and dangerous underground denizens. Although only infrequently encountered, umber hulks have become well known because of their distinctive appearance and the ferocity of their attacks on adventurers. I have heard numerous stories of small bands of umber hulks destroying larger parties of experienced adventurers, leaving nothing but dropped weapons and debris behind.

Umbur hulks are extremely large, bulky creatures often standing nearly three yards tall and over one and a half yards wide. Their powerful arms end in hands with claws like iron that are capable of ripping through solid stone quickly. The rest of their stout bodies are very muscular, but because of their weight (1,500-1,750 lbs.) and size, umber hulks are slow, awkward creatures. Such a creature's mouth is filled with many small teeth, but the major damage is inflicted by the umber hulks two sets of mandibles.

In addition, the umber hulk has two sets of eyes, one on the outside of its flat head and the other in the middle of its forehead. The eyes on the outside of its head are white with black irises, while those on its forehead are purple with yellow or amber irises. The creature lacks a nose but breathes through gill-like structures on its almost nonexistent neck, evidence of a possible previous aquatic existence. It can thus eat and breathe at the same time. The color of the umber hulk's tough hide is black but lightens to a grayish or burnt brown hue on the head and front. The mandibles and claws are ivory colored. Adventurers have been known to mistake umber hulks for some other type of creature at a distance of 15 yards or more because of their dark coloring.

Umbur hulks are, as noted earlier, well known for their ferocious attacks on adventurers—particularly humans, which are relished. Using their powerful claws and great strength to rend opponents, they have been known to kill with a single attack, literally ripping their foes in two.

These monsters usually prey on other subterranean creatures like anhkhegs and small purple worms, against which the umber hulks developed their powerful offensive array. It is said that umber hulks allow themselves to be swallowed alive by great purple worms for the thrill of "tunneling out" and slaying the worms.

Umbur hulks use their great claws and strength to good advantage in the subterranean areas they haunt. The area surrounding an umber hulk's underground lair is crisscrossed with numerous tunnels, making it difficult for other creatures to find the lair itself. Some of the tunnels are dead ends, while others lead back to their points of origin in very roundabout fashion. All such tunnels are well known to the umber hulk, which uses these passages to catch victims by outflanking them.

The reverse also holds true, as the umber hulk can use its many tunnels to elude determined pursuit. While it is not impossible to hunt down a fleeing umber hulk, it is difficult even for experienced trackers such as rangers to do so as it leaves few tracks on rocky floors. The umber hulk also could lead pursuers around in circles long enough for others to join it and turn the tables on its hunters. In dire circumstance, an umber hulk will go to an area with a deliberately weakened ceiling, so it may cause a cave-in and later escape. Deliberately caused floods are also possible, as the umber hulk can breathe water for short periods (up to 10 minutes).

Umbur hulks are very destructive creatures that will always attempt to destroy what they cannot use. Thus, any clothing found in the lair will be shredded, armor torn and dented, weapons broken and useless. Umbur hulks are wanton killers whose courage is not always overcome by self-preservation. They will almost immediately attack any creature they deem weaker than themselves. Only the sight of gold or platinum, in very large amounts, will halt their attacks once begun.

The most dangerous aspect of the umber hulk is its two sets of eyes. Should any creature of even slight intelligence meet the direct gaze of an umber hulk, it be-

comes instantly befuddled, often attacking its companions or standing dazed as the creature advances. This "gaze of confusion" is magical in nature and is constantly in effect. Other umber hulks are immune to the effects, which affect the victim's brain through the optic nerve in a manner which I have yet to discover. The effect seems to be created by the pair of eyes in the forehead, for the vodyanoi, the umber hulk's marine cousin, lacks this set of eyes and the peculiar gaze. The victim recovers shortly, usually within a few minutes, unless the monster has eaten him.

Both male and female umber hulks appear the same externally, equal in size and ferocity. However, female umber hulks are much rarer than the male, with only one umber hulk in four being female. For this reason, the males are very protective of the females, often sacrificing their own lives in the females' defense.

Little is known about how umber hulks reproduce. The female bears her young live a year after mating, producing one to three "hulklings." The young are quickly able to move about and defend themselves, developing all of their special powers with great rapidity. The mother is especially dangerous during this time, as she will hunt down and kill as much food as possible to feed her young, who eat voraciously. After two years, the young umber hulks learn to hunt at their mother's side. Those that have survived this long are considered mature adults in every respect. After a few months more, the young leave, and the mother may start another litter. Male umber hulks live an average of 50 years; females, 75 years.

Like most underground creatures, umber hulks have more highly developed senses of smell and hearing than eyesight, and they use the former two senses when searching for prey, tracking and fighting without penalty for darkness. However, their eyesight is not bad, and umber hulks have no trouble seeing prey at normal distances. Like most underground creatures, umber hulks dislike bright light, but they suffer ill effects only from the brightest sources. Umbur hulks venture above ground only at night and only when des-

perate for prey.

Umber hulks are reasonably intelligent creatures and have developed their own spoken tongue. The language is fairly easy to learn and understand as it conveys only limited information, but only magical intervention (*clairaudience* or spying while *invisible*) permits anyone to hear the language used. However, "Hulkish" is difficult to actually speak as umber hulks make some sounds that are impossible for humans to duplicate. It is a very direct, concrete, brutal tongue as befits their nature. The umber hulk also uses various grunts, hisses, and gestures for added emphasis when speaking, as well as mouth, mandible, and eye movements.

Though umber hulks are basically loners, they will sometimes cooperate with other evil creatures, including evil humans, if paid in gold and platinum or, possibly, human victims. They will serve in any capacity—as guards, part of a main

attack force, even as manual labor—as long as they receive their gold and are not expected to risk their own lives in vain. They will not venture above ground for any price and are therefore of limited use. Their fickle nature causes them to turn on their "masters," often for no reason.

This begs the question, of course, of what umber hulks do with their monetary gains. No one knows, though not all umber hulks seem to value precious metals. It may be that they use their gains as part of their economy, if the rumors of their cities beneath the earth are true, or it may be that the umber hulks consume such metals for dietary reasons (finding coins to be excellent gizzard stones). None can say.

The lair of an umber hulk is a large, spacious cavern or room, the walls of which are always covered by marks from the umber hulk honing its claws or possibly from having carved the cave from the stone itself. Attached to the large cavern

are numerous smaller rooms of storage for what few personal items, such as treasure and food, such monsters accumulate. All the rooms will be littered with the remains of previous victims brought here for leisurely consumption. The treasure cave is usually hidden by rocks and debris, with simple but deadly traps such as rock-slides. Small items can be found scattered throughout all rooms—curios that caught the monster's interest, such as peculiar gems or devices from a past victim.

Dead umber hulks (the only good ones, some say) have numerous uses. The hide of an umber hulk is extremely tough and damage resistant. Some underground races, notably kobolds and goblins, cure the hides of umber hulks and make armors and shields out of them. (Although they would not dare to attack a living umber hulk, these races recover their prizes from beasts slain by disease, age, or adventurers.) The hard mandibles are

Illustration by Thomas Baxa

used as hand-held weapons, and the claws are turned into spiked clubs and maces. The eyes from the forehead are often needed by magic-users for potions and magical inks, and they can be sold for a profit to alchemical shops or wizards' guilds.

Though it poses little threat to normal human existence, the umber hulk is a notable danger to those who venture beneath the earth in search of adventure and riches. It makes the life of a farmer much more attractive.

Gaming notes

Most umber hulks have strengths of 19, equal to a hill giant, but one in 20 has a strength of 20 and does 1d6 + 6 hp damage with each claw, rather than the 3d4 hp damage listed in the *Monstrous Compendium*. If the umber hulk's strength should be reduced, claw damage should be reduced accordingly. Damage done by the mandibles remains the same.

The effects of an umber hulk's gaze are like the effects of a *confusion* spell lasting 3d4 rounds, affecting as many victims as are looking at it within 40' of its front. UMBER HULKS themselves are immune to the effects of the gaze, as are vodyanoi, creatures already suffering from *confusion*, and *mind-barred* victims. Use the following chart (from the description of

the dracolisk in the *Monster Manual II*, page 55) to determine the chances of meeting an umber hulk's gaze:

Character is—	Chance to meet gaze
Surprised	7 in 10
Viewing monster	3 in 10
Attacking normally	3 in 10
Avoiding gaze	1 in 10

When born, umber hulks are helpless, but by three months of age they have 1 + 1

HD, are 1' tall, and do 1d4/1d4/1d2 hp damage with claws and mandibles. They grow thereafter at the rate shown in the UMBER HULK GROWTH TABLE.

Extremely bright light, such as sunlight, causes the umber hulk to take a - 1 penalty to hit and to saving throws.

The claws and mandibles of dead umber hulks do 1d4 hp damage per blow when used as weapons. Armor made from the hides of umber hulks is AC 4 and resembles a suit of plate armor. The eyes from the forehead can be worth 100-400 gp apiece to the right people. Ω

UMBER HULK GROWTH TABLE

Age	Hit dice	Claw damage	Mandible damage	Duration in rounds of confusion gaze
0-2 mo.	1-1	-	-	-
3-5 mo.	1+1	1d4	1d2	1d4
6-8 mo.	2+2	1d4	1d3	1d4
9-11 mo.	3+3	1d6	1d4	1d4
12-14 mo.	4+4	2d4	1d6	2d4
15-17 mo.	5+5	2d4	1d6	2d4
18-20 mo.	6+6	2d6	1d8	2d4
21-23 mo.	7+7	2d6	1d10	2d4
24 + mo.	8+8	3d4	1d10	3d4

The ecology of the unicorn

by Roger Moore

"You would know about the unicorn?" asked the dryad. Her green eyes widened. "You are a hunter?"

After I assured her that I bore no weapons or armor, and sought to learn about the unicorn for my own curiosity, the dryad looked at me with head tilted. "Most of the mortal folk hunt the Free One for its horn, the magical horn, they would slay it, take its horn, iron in their hands and ice in their hearts, and we who loved it are left with the body, such is the way of the mortal folk. Long the Free One runs, far the Free One travels, deep the Free One hides from the mortal folk. The horn is its heart as the unicorn is the forest's heart, would you run if mortals chased you for your heart?" In such a way did the dryad speak, her words and sentences running together like water in a stream.

I bowed my head to hear this; I was not a killer. It seemed the dryad saw this: she bade me sit with her on a mossy stone for a while, and she told me of the unicorn.

The unicorn, she said, is many things. No two people will see the same unicorn, though one may be seen by many. Mortals see it and call it shy, fierce, proud, free, the spirit of magic, the spirit of unconformity, the symbol of purity, truth, change, goodness, chaos, innocence, grace, beauty, secrecy, and a thousand other things. There is truth in each of these, but each of them alone is not enough, and all the words that could be spoken would not a unicorn describe.

To human eyes the unicorn is less like a horned horse than is generally believed; it is smaller and more graceful than a horse, and far more beautiful. Unicorns are generally white in color, though some claim to have seen gray, black, silver and gold ones, and one or two adventurers speak of spotted ones. Their horns are most often a mother-of-pearl color, giving off a rainbow of hues in the sunlight; again, there are reports of silver, gold, and black horns as well. The cloven hooves of the creature are gray or silver. All unicorns have a wild silken mane that flashes in the wind as they run, a tail like a lion or wild boar, and a beard like a goat. Some say, though, that the strangest part of a unicorn is its eyes, for they are many colors at once and change even as one looks at them. No one can well remember the color of a unicorn's eyes.

You will find in the world learned sages who tell you the unicorn is not exceptionally bright, and that if you could converse with one you would get

little more than if you'd spoken with an average man who had lived in the woods all of his life. Yet little do mortal folk know of what a unicorn truly thinks. They are older than the calendars most mortals keep, and wiser than most sages. Their knowledge is not of building fires and laying stone, but of the nature of living things, the wisdom learned from watching the stars pass in the night, the endless cycle of nature repeated again and again yet differently every time. They know what is in the heart of a man or a woman, and can read meaning into the turn of the wind, the fall of a leaf, the sigh of a child, meanings no one else knows. Dearly they love secrets, and dearly they keep them.

It may be said that a unicorn lives for itself. It will defend its wood and its friends, but it exists for its own sake and serves no one but its own will. Even magic is powerless to control them; their wildness is too great to be constrained by a dweomer. They eat when it pleases them and sleep when they like; they feast on tender grasses and honeysuckle, sweet roots and bark, and some say they can draw energy from drinking the winds if they need. It is known that the best place to see a unicorn is near a still pond, for they love to look at themselves reflected therein; a vanity, perhaps, but they are entitled to it as well as anyone.

It is true, too, that unicorns are strong. Theirs is an endless strength; they may run for days without tiring at full speed, passing the winds and flashing through even the densest forest growth. "Chasing the unicorn," the common folk say when they mean someone is wasting time; "catching a unicorn," they say of someone doing the impossible.

The powers of the unicorn's horn are debated by serf and king alike. It is known that unicorns cannot be poisoned, and that the horn will protect a man, though to lesser effect, from toxins of all kinds. Yet there are always tales of other, hidden magicks that the horn can perform. A ranger will remember a unicorn coming upon him as he lay dying in the woods of a goblin's arrow; the unicorn but touches the infected wound and it is healed at once. A lost child, when found, will tell of seeing a "one-horned deer" who cured his sicknesses from eating wild mushrooms or berries with a tap of its horn, then guided the child home again. There is even a legend that two lovers, chased into a forest by their enraged families, fell from a low cliff and one of them

was slain; the survivor would have died of grief but heard a low sound, and beheld a unicorn coming, who touched the other one once and restored the lost one to life before fleeing. What can be made of all this is beyond even the sages to say; but clearly, one should never take a unicorn for granted.

A unicorn runs more like a deer than a horse, travelling in great leaps that clear the height of a man at times. Because of their speed, there are precious few creatures who will ever get close to one without its permission, and fewer still since unicorns have a magical intuition about the approach of anyone who has evil thoughts or has the intention of harming them. Unicorns avoid all but those of good heart and those who love the forests; the rest see little more than their tails flicking as they leap into the distance, and often they will see nothing of them at all; unicorns love to hide and can be more quiet than an empty cathedral when they want to be.

No one knows how old unicorns become. The dryads say that it is rarer for the moon to turn blue than for unicorns to mate, and the birth of a foal is cause for riotous joy among all the inhabitants of a unicorn's wood. Some elven folk remember tales of their ancestors of generations before, telling of the same unicorn those elves see now, which if true means that unicorns live for thousands of years. The dryad I spoke with had known two unicorns, and neither of them knew how old they were, much less how much time had passed since the week before. If time means little to elves, it means nothing at all to unicorns, and each day to them is special and new. The chaos in them casts boredom aside; a unicorn can watch the same event over and over, and each time will see something new about it to hold its interest.

Who befriends a unicorn? Everyone knows that a maid, old or young, who is good at heart will stand a fair chance of seeing and perhaps even touching a unicorn. Sometimes it happens that the maid may even gain the unicorn's agreement to serve her as a steed, and the unicorn will be faithful to her for as long as the maid is good; the unicorn will suffer no one else to ride it, however, and may not even let the maid ride it if the maid comes to believe she is the unicorn's master. No one is the master of a unicorn.

Druids also like unicorns, not so much for their goodness (druids also like green dragons) but because unicorns are so

much a part of the forests the druids protect. At times a unicorn may give aid to a druid, but always it is because the unicorn chooses to do so, not from any compulsion the druid may exert by charm. Rangers and unicorns seem to do well together, and unicorns will even let themselves be seen by male rangers and touched by them, though only female rangers may ride them. Good bards are known to chase after unicorns, and mad chaotic bards as well; the sight of a unicorn brings bards to tears, and they will write volumes and volumes of poems and tales and songs about their beauty, and recite them every chance they get.

Of the true woodland folk, faeries and elves are among a unicorn's closest friends, and some of them even have speech with unicorns. Dryads, satyrs, nymphs, pixies, and sprites see them often enough, and it is said that treants, who may be the only beings to live longer than unicorns, know more unicorns personally in their lifetimes than any human could guess at. All of the true wood folk except the evil ones love the unicorn and would throw down their lives for it, and even the evil ones would not cause it harm; unicorns are fearful when aroused for fighting, and have slain ogres and worse with a single thrust of their whorled horns.

Who is a unicorn's foe? It is true that

they avoid all who are evil, and who would cause them harm. Yet it is also true that those who are selfish and petty, who desire dominion over their fellows, and who are blind to the goodness and innocence of childhood will never see the horned one. If one cannot see beyond the reach of his own grasping hands, he will wander the forests of the world and see nothing at all but trees.

Such was the tale the dryad told me, and I was utterly silent as I heard it, and afterward. I felt the wonder in me rising and my thoughts were adrift; the dryad seemed to know it and she laughed.

"Stranger, I have told you that a thousand words could not say what the sight of one unicorn can, and you look as if you've seen one a'ready."

"Your story has caused it," I replied, embarrassed. "I am no one like a bard or a prince or a ranger; I am a wanderer and the road is my home. I have heard many tales and seen many strange beings in my years, but never such a creature as you have told me."

The dryad's eyes twinkled merrily. "And if you were to see one, what would you do?"

I thought for a moment and laughed myself. "In truth I have no idea. Perhaps all in all, I would do nothing but wonder at it. Beautiful things are rare in the world, and, for myself, to be lucky

enough to see a unicorn would be all I could ask."

"Lucky thou are, then," said the dryad. "Look over your shoulder, slowly and with care." Her eyes were shining like stars and her face glowed with awe. She was looking behind me.

For all of my life I remembered that moment, as I watched her face and it dawned on me what she meant. In that moment I had an awareness of someone near me, very close to me, someone I had sought all my life. Even though I am older now than almost any man, I still remember the last few seconds before I turned around, and in the light filtering through the leaves and in the silence of the primeval wood, beheld the unicorn.

APPENDIX

Unicorns are also known as alicorns, monocorns, and have the technical name of *monoceros* in sages' texts.

If desired, the awe effect of seeing a unicorn may be simulated by giving them a charismatic power that causes all creatures and beings with less than one hit die to be rendered immobile upon seeing one for 1-3 rounds; more powerful creatures will be able to act normally, but the sight of a unicorn will still affect them deeply in some manner. Good beings will love and admire them, neutral ones will seek to control or capture them, and evil

CAST YOUR OWN FANTASY FIGURES

Now there are nine tri-cavity molds and more are coming. The figures are designed especially for role-playing and they are super!

Casting your own figures is almost as much fun as playing the game.

CALVERT TX 77837

A FUN AND EASY HOBBY

ones usually hate them, for the unicorn's beauty reminds them of the ugliness of their souls.

Unicorns may be treated as having a 25 wisdom for purposes of immunity to *charm* and *hold* spells or powers, as per the DEITIES & DEMIGODS™ Cyclopaedia; *animal friendship*, *snare*, *trip*, and *sleep* spells, as well as any other enchantment/charm spells, do not affect them either. They will note a *hallucinatory forest* for the illusion that it is. Being immune to *death* spells covers all enchantment/charm, conjuration/summoning, or necromantic spells that cause death with or without saving throws (including *finger of death*, *destruction*, *symbol of death*, and *power word*, *kill*).

If desired, a unicorn may be able (once per day or less often than that) to simulate one beneficial clerical spell of any level with a touch of its horn. The effect of this touch will take place instantly. Unicorns will only use this power if another creature or being is *in extremis*; DMs should use this power with care.

The *dimension door* power of a unicorn will only rarely be used, but it takes effect instantly at the unicorn's desire. A unicorn could, for instance, vanish just a moment before being struck by an arrow or weapon if it was aware of the object's approach, and could even evade a *fireball* as it travelled on its way.

The druid spell *call woodland beings* is

not considered a *charm-type* spell; it does not put the unicorn under any compulsion to obey the druid, any more than any other creature called must obey the druid. A summoned unicorn will be aware that a druid is "calling" for assistance and may decide to help (represented by the saving throw vs. spell). In no case will a unicorn approach nearer than 24" from a druid if the presence of any enemy (an evil character or a hunter of unicorns) is sensed, and a unicorn will *dimension door* away if necessary to escape a trap.

Interestingly, lower-level druids have a marginally better chance to summon a unicorn for aid (using *call woodland beings*) than higher-level druids; this says something (indirectly, at least) about the unicorn. The way the spell is moderated, a lower-level druid has a better chance of *failing* to attract those woodland creatures mentioned ahead of the unicorn on the list, which means the chances for that druid to *succeed* in calling a unicorn (the last entry in the sequential list of possible creatures) are correspondingly better. And in the long run, a unicorn is more liable to heed the summons of a lower-level druid because (a) the druid is relatively more likely to need help and (b) a lower-level druid would not be seen as much of a potential threat to a creature as powerful and versatile as the unicorn. m

Ecology of the Vampire

By Tim and Eileen Connors
Art by Pat Loboyko and Marc Radle

On the dark side of a mountain, a small shack hides in a forest of evergreens. The sweet smoke of boiling sap rises from its chimney and joins the night. Inside the cabin, a woman licks blood from her fangs and rises from a dying man on the floor. Blood trickles from the twin puncture wounds at his neck. Somewhere outside, wolves announce a midnight hunt. And solitary birches, thin and pale, bleed their sap into buckets.

The woman smiles. A perfect night.

When darkness falls, vampires rise from their graves to gorge themselves on the blood of the living. Their fountain of youth flows through the veins of men, and their immortality comes with the curse of a doomed soul. These are creatures from the Old World. They took our ancestors by the throat. And tonight, they eye our children from the mist.

Becoming a Vampire

When a humanoid or monstrous humanoid dies from a vampire's bite, the curse of vampirism quickly corrupts the corpse. The silver cord that ties the victim's soul to its body does not snap as it should, and the soul remains tethered to the dead vessel, slowly filling with blood lust. The soul struggles against the cord and reaches for the afterlife, but its silent screams are in vain. The gates of heaven and hell

diminish as blood lust slowly reels the cord-strangled soul back into its corpse.

One to four days after the victim's death, a new vampire or vampire spawn rises as a mist around its grave. A victim with less than 5 HD rises as a vampire spawn. A victim of 5 HD or more rises as a vampire.

Vampires may also be born. A pregnant woman who survives a vampire bite has a 25% chance of birthing a dhampir—a free-willed half-vampire child. Because dhampirs have a penchant and ability to kill vampires, most vampires are careful to shun pregnant victims. For this reason, vampires find the scent of a menstruating woman particularly attractive.

Male vampires who are fully fed may mate and sire children with a living female. This happens infrequently because the female must not only conceive willingly but must also survive a difficult and bloody labor and supplement the babe's milk with her own blood. Vampires who sire in this fashion are often new vampires who, within days of their own "birth," return to their homes and mate with their living wives. Babies are invariably dhampir. These half-vampire children grow into their powers over time. While young, most do not realize the significance of the bats that nest in their attics or the wolves that shadow them in the forest.

Physiology

Before a vampire rises for the first time, any maggots or bacteria infesting the corpse erupt through the skin, shrivel, and die. Wounds close and heal. When the “newborn” vampire emerges from its grave, it easily passes for the living creature it once was. Indeed, it appears at least as healthy as it did the day it died. This allows many new vampires to masquerade as living humanoids and move unnoticed among the populace. The act of feeding reveals the charade, however; the creature grows its fangs and snarls like a predatory wolf.

With the exception of their hair and nails, vampires never grow, gain weight, or age. A boy turned into a vampire at age 6 appears remarkably unchanged four centuries later. Nevertheless, vampires are not timeless. Decay devours them with patience. In another four centuries, the child vampire’s skin tightens over a bony frame, his eyes shrink to opals, and his nose blackens and sloughs off. He stands supernaturally still, and a chill precedes him when he moves. At this stage in his unlife, no creature would mistake him for anything other than the undead predator he has become.

The powerhouse of every vampire is a heart that never beats. Capillary action carries consumed blood along constricted veins to the heart. Here, tongues of negative energy lap it up and vomit raw power through the vampire’s arteries to its muscles. Well-fed vampires enjoy prodigious strength, lightning fast reflexes, keen intellect, sharp senses, and irresistible charm.

To keep its negative energy at peak levels, a vampire must feed daily or succeed on a Failure to Feed roll. This DC 15 Fortitude save must be made every day the vampire goes without blood (cumulative +1 DC/day). Once fatigued, the Failure to Feed DC increases to DC 20 and the check is made once per week to avoid exhaustion (cumulative +1

DC/week). The first successful blood drain attack reduces exhaustion to fatigue. The second removes fatigue.

Not just any blood will strengthen a vampire. Dried blood, bottled blood, and the blood of a dead creature do not sustain a vampire. These sources no longer carry the necessary component—vitality. Vital blood is adrenaline-rich blood that the victim’s heart pumps directly into the vampire’s mouth.

Taste derives from the strength, passion, and emotional state of the victim. Some vampires swear that blood suffused with love is liquid ecstasy. Others prefer to terrorize their victims—sometimes for days—before digging their fangs into a vein coursing with adrenaline and flavored with fear. Vampires can survive on live animal blood, but it lacks the sweetness that the blood of an intelligent creature, capable of deep emotion. On the other hand, the blood of a raging lion far exceeds the vitality of that of an infirm human. This is why vampires hunt rather than farm bedridden humans. It is, also, why vampires do not prey on the same victim repeatedly. The blood sours as the victim’s strength ebbs.

Psychology

A new vampire reflects on its living memories as through the blackest of moods. Vampirism connects the creature to a gestalt evil, perverts the creature’s personality, and crushes its moral compass. Every character flaw, weakness to temptation, and evil proclivity heightens and fills the void left by virtue. The vampire lives unchecked by conscience and driven by its lusts. The noble, romantic vampire of bardic song may exist, but far more common are hateful creatures willing to tear the heart out of any maiden they meet.

Vampire personalities vary from bestial to aristocratic, and many vampires can operate at both ends of the spectrum. Every vampire considers itself superior to living creatures. Those of the bestial persuasion become apex predators. Those with aristocratic backgrounds revel in finery and debauchery under the guise of charismatic nobility. Occasionally, haughtiness leads a vampire to underestimate the living, but most often, its sense of superiority is entirely justified.

Blood lust gnaws into every aspect of a vampire’s psychology. A vampire can never conquer or quell its need to feed, and the constant urge for blood distracts the vampire and forces him to live in the moment. Only well-fed vampires can contrive and execute plans that do not involve feeding or protecting or expanding their blood territory. Centuries of blood addiction eats at their minds the same way decay ultimately consumes their bodies. Even the most successful vampire eventually goes mad from blood lust.

Vampires have no fondness for change, and they endure the passage of time as a necessary evil. Venerable vampires have little patience for novelties such as automatons or clockwork magic, and the vampire hunter can exploit such ignorance. Old World vampires dress in outdated garb and follow the old ways. To look in their thirsty eyes is to see ancient cities long blown to dust.

Society

A new vampire lives under the command of the vampire who sired it and remains enslaved until the sire's destruction. Each enslaved vampire can sire and enslave vampires of its own, creating a pyramid of control called the Tree of Chains.

A free-willed master vampire commands his entire Tree of Chains with as little or as much direction as he pleases. His tree's growth is limited only by the fact that no vampire can enslave more than twice its own HD worth of "children" at any one time. Any child that would exceed this limit rises as a free-willed vampire or vampire spawn. A vampire can voluntarily free an enslaved child to make room for a promising new child, but more frequently, the ruling vampire kills the existing child and all of that child's progeny to reduce territorial competition. This pruning temporarily reduces the tree's strength but promises stronger future growth.

The Tree of Chains and blood territory play key roles in vampire society. The lowest vampire caste includes new free-willed vampires with no Tree and no territorial claims. Such vampires typically grow their Trees on the fringes of vampire society or in uncommon territorial niches. A coffin among the boxes of a gypsy caravan might quickly grow into a Tree of Chains composed of the entire gypsy band, or a group of outlaws might find they hunt for blood rather than coin.

Such a tree represents the next lower caste in vampire society—a master vampire whose territory cannot support his tree. To secure fresh blood, the master vampire must branch into a populated area, and that means challenging another master vampire for territory. These challenges rarely succeed, because most populated areas are controlled by the next and highest-level caste—master vampires with Trees of Chains large enough to defend their territory but lean enough and disciplined enough not to outgrow it.

The highest-level caste includes the ancient vampire clans, who have long-

established traditions and territories. Like crime families, each clan claims one or more of the world's major cities as its blood territory. The clans ally, challenge, and avenge each other frequently, and vampire wars unfold in the shadows of urban centers.

Clan-Specific Powers and Weaknesses

Vampire clans often enrich their lines by passing traits to their spawn. Just before the potential child loses consciousness from blood loss, the vampire opens one of his own veins—usually on his chest—and forces the victim to drink. Days later, the risen child enjoys one of his sire's at-will abilities (equivalent to the power of a 3rd level spell or less for unwilling victims and a 4th level spell or less for willing victims).

Through this ritual, the Blackcloak Clan has granted countless generations with the ability to fly. Woes betide the manor that discovers a swarm of Blackcloaks wheeling about its towers. The Northwinds Clan moves inside icy clouds of fog that freeze and shatter foliage as they pass. And once a Shadowlicker has tasted a person's shadow, it can enter the person's residence without the normally required invitation.

Detecting a Vampire

Vampires rise from their graves and travel in mist form, neither disturbing their gravesites nor leaving tracks. Vampire hunters must rely on secondary clues. A cemetery with its holy symbols thrown down, laden with ground-hugging fog, or devoid of birds may harbor a vampire. But which grave holds the vampire? To find out, different villages follow their own folk traditions with varying degrees of success. In the Margreve, a naked virgin male rides a white stallion over the gravesites. Wherever the horse bucks wildly, a vampire is sure to lie.

Coffins. Not all vampires rest in coffins or sleep buried in graveyards. Any box that blocks sunlight, keeps out running water, and lies atop the vampire's native soil suffices. Urban vampires lair in sewers, abandoned warehouses, attics, and any other dark, infrequently visited nook. Vampires who live in perpetually dark areas and who do not prepare spells have no need to retire to their coffins daily. Some vampires carry their coffin in a soil-lined bag of holding. A vampire hunter has little hope of finding the resting place of such a vampire directly.

Magic. The Silverblood Dhampirs, a society of vampire-hunting clerics, lo-

Living under Vampire Rule

North of the Margreve, in the Imperial Principality of Morgau and Doresh, vampires roam openly and rule proudly. Depravity, decadence, and the worship of dark gods abound. Here, the living are little more than property, drained and dispatched as the vampires see fit.

Many living slaves long for their masters to drain them of blood, so they can escape the "tortures of the living" and gain social status as vampires. Vampire masters occasionally grant such rewards. If the slave is clever, he makes some plans before he receives the death-bite, such as hiring assassins (or do-good heroes) to kill his sire after the planned death-bite. This frees the slave-turned-vampire from mental enslavement on the master's Tree of Chains.

The Imperial Principality frequently hosts hunts in its hills and forests and stages gladiatorial fights in its cities. In these spectacles, living combatants clash, and vampires cheer and salivate at the blood that sprays into the stands. This foreplay lasts for hours before culminating in a vampire's blood drain of the winner and the lucky winner's rise into the ruling class.

Once a year, tradition demands that a vampire elder free the winner rather than kill him. An arcane tattoo forever marks the champion and grants him perpetual freedom from all vampire predation. One of these lucky souls recently emigrated to the Free City of Zobeck where he runs a gladiatorial pit under the kobold ghetto.

cate vampires by starting at the graveyards. If the Silverbloods are lucky enough to find a vampire spawn, they kill it and then cast *Speak with Dead* to find out who the spawn's sire was. In this way, they slowly climb the Tree of Chains until ultimately confronting the master vampire.

Reflection and shadow. Like heaven and hell, light refuses to recognize the vampire's cursed soul and does not honor the vampire's presence with reflection or shadow. To avoid detection and the bitter reminder of their cursed existence, vampires shun environments with mirrors, pools, or sources of bright light.

Odd conditions and traits. Other vampire traits include wearing of foreign or old-fashioned garb, never eating or drinking, walking with su-

pernatually quiet footfalls and having terrible halitosis. A watchful hunter can notice these signs with a successful Spot of DC 15 + the CR of the vampire. Even under overcast skies, vampires infrequently appear during daylight hours.

Repelling a Vampire

For all their power, vampires have significant, exploitable weaknesses.

Alchemy. Vampires cannot tolerate the smell of garlic, wild roses, or rowan berries and will not enter an area laced with them. In vampire-plagued villages, wreaths of garlic bulbs hang on doors, and villagers perfume themselves with concentrated rose oils for the fortnight following a funeral. These protections encourage a browsing vampire to go to the next house,

but they do not thwart a vampire who is determined to take a particular victim. Such a vampire need merely make a Will saving throw with DC 20 for garlic, DC 24 for rose oil, or DC 19 for rowan berries to bypass the barrier; even with a successful save, the vampire takes 2d8 damage for passing such a barrier.

Conviction. More powerful apotropaic objects include mirrors, holy symbols, and religious relics. When someone presents these objects with conviction as a standard action (with a successful Knowledge (religion) check of DC 15 + the CR of the vampire), the vampire recoils with a hiss of disdain. The vampire may not touch, engage in melee, or come within 5 ft. of someone brandishing such an object. Vampires in this situation use their domination ability to crush the will of the presenter. If successful, the vampire forces the presenter to throw the object aside and attack his comrades instead.

Authority. Vampires cannot enter a home or other building without first being invited by someone with the authority to do so. Once invited, future visits require no further invitation unless the owner sells or otherwise relinquishes the property to another party.

Consecrated land. Despite popular folklore, vampires may enter consecrated areas. For instance, in what later became known as the Blood of the Empty Mass, villagers in Godfrey's Hollow slew their parish priest after they discovered him retiring to a coffin beneath the rectory.

Running water. Vampires cannot cross running water unless carried across in their coffin or conveyed by ship. Folk magic descended from elvish vampire lore suggests that this is because running water is pure and incapable of holding magic or curse. The desert preachers of the Golden Goddess teach that baptism through running water is the door to Heaven—a door forever closed to the vampire. Communities have long exploited this vampire weakness to great effect, banishing vampires to islands when

Vampires in the Real World

Dr. John Polidori's *The Vampyre* published in 1819 introduced and popularized the charismatic, sophisticated vampire that continues to dominate contemporary fiction. The historical vampire that had entire nations staking and beheading corpses was quite a different beast.

Prior to the acceptance of germ theory, many people blamed vampires for the sudden deaths of multiple family members. The first to die must have become a vampire, for why else would the family be chosen to suffer a similar fate? Hard-hitting diseases such as tuberculosis that plagued victims with pallor, fatigue, and night sweats—sure signs of a vampire's work—fanned the flames of vampire hysteria.

In 1190, William of Newburgh wrote in *Historia rerum Anglicarum* that "one would not easily believe that corpses come out of their graves and wander around, animated by some evil spirit, to terrorize or harm the living, unless there were many cases in our times, supported by ample testimony." Indeed, the idea of vampirism was so powerful, widespread, and enduring that it survived the Enlightenment, when the West discounted so many other creatures and folktales.

In Eastern Europe, communities took time-honored steps to prevent or thwart vampirism. Corpses were buried upside down so that they would dig down instead of up. Pottery emblazoned with "Jesus Christ conquers" was placed on the corpse's chest. Gypsies drove iron needles into the corpse's heart. As recently as the 19th century, Romanians placed garlic in the deceased's mouth and shot bullets through the coffin. For resistant cases, they dismembered and burned the body, mixed the ashes with water, and administered the concoction to family members as a cure-all.

After Austria gained control of northern Serbia in 1718, officials noted the locals' practice of exhuming bodies and testing them for vampirism. If the cadaver appeared well-fed (plump with decomposition gases), displayed lengthened nails or teeth (receding cuticles and gums), or showed signs of blood drinking (bled from the mouth), the corpse deserved a vampire's death. Someone, often a relative of the deceased, took up a mallet and drove a stake through the corpse's heart, puncturing its bloated chest and releasing a violent burst of foul gas and blood. To be absolutely certain of the vampire's destruction, they severed the knee tendons, beheaded the corpse, and spiked the body to the earth.

they cannot be killed. In the Northern Wastes, meltwaters flowing around ice caves form effective vampire prisons. And until the recent quake, the Vaults of al-Kupa were lined with shelves of glass globes, each composed of a mantle of holy water everflowing around an imprisoned ancient vampire in gaseous form.

Saving Souls

When someone dies from a vampire bite, friends and family have little time to save their loved one's soul. If they destroy the sire before the deceased rises as a vampire in 1–4 days, vampirism never settles on the corpse and the deceased's soul remains free. However, if their loved one rises as a vampire, no mortal magic can break the curse of vampirism. The family has only one choice. To save their loved one's soul, they must first destroy him.

Slaying a Vampire

When a vampire is destroyed, the silver cord binding the soul to the undead body unravels and snaps. The curse of vampirism dissipates, and the freed soul passes on. Thereafter, resurrection and true resurrection can recall the soul to life if the soul is willing.

Immersion. Immersing a vampire in running water reduces its hp by one third of its normal total per round. Once immersion reduces the vampire to 0 hp, the vampire is destroyed.

Sunlight. A vampire exposed to direct sunlight teeters on the agonizing cusp of destruction. It may take a single move or standard action. If the vampire does not escape the sun's rays in the next round, it is destroyed. The Grisel dwarves, who defend the Ironcrag's northern border from vampires, harness the sun's power in another way. Their Sun Axes, empowered daily with the dawn's first rays, are said to slice through vampires like razors through butter.

Damage. When a vampire is reduced to 0 hp, it automatically assumes gaseous form and attempts to escape. If it does not reach its coffin home within 2 hours (or 9 miles), the vampire is

destroyed. Once at rest in its coffin, the gaseous vampire lies helpless for 1 hour, after which it gains 1 hp, reactivates its fast healing, and is no longer helpless.

Staking the heart. Pounding an ashwood, hawthorn, or rowan stake through a vampire's heart instantly slays the creature. The late vampire hunter Frangorn Nith gained fame for using a unicorn horn with equal success. Vampires are well aware of the danger that staking poses and many wear breastplates or employ *stone-skin* to protect themselves. Advanced gargoyle vampires and others with significant natural armor are particularly difficult to stake.

Staking a vampire slays it but does not destroy it. The vampire returns to life if the stake is removed, even after the body has long reduced to dust and blown away. More than one adventurer has regretted removing a curious stake from its wedge between the flagstones. To prevent the vampire from returning, wise vampire slayers decapitate the creature and fill its mouth with garlic or holy wafers.

Vampires of Legend

Twelve clans descend directly from the ur-Vampire Lucien Twice-Fallen,

and at the top of each of their Trees of Chains sits a Vampire of Legend. These vampire lords were ancient when half the world's religions were new. Holy relics melt against their foul skin, and running water stagnates and blackens before they ever step foot in it. Skies darken in their presence, and every light source grants them a shadow that moves, detaches, and attacks as they command. Stakes splinter against their chests.

Like major artifacts, each Vampire of Legend has a specific means of destruction. With a bit of creativity, enterprising GMs can develop entire adventures or even campaigns based around the destruction of but one of these Vampires of Legend. enterprising GMs can develop entire adventures or even campaigns based around the destruction of but one of these Vampires of Legend.

Vampire Lore

Characters with ranks in Knowledge (religion) can learn more about vampires. When a character makes a successful skill check, reveal the following lore, including the information from lower DCs.

Table: Vampire Lore

DC	Result
10	Vampires are cursed undead creatures with an insatiable thirst for blood. They avoid mirrors, garlic, rowan berries, and wild roses.
15	A vampire can be destroyed by sunlight, decapitation, or a stake through the heart.
20	When reduced to 0 hp, a vampire becomes a mist that floats back to its coffin. Here, it reforms into its physical body and lies helpless for 1 hour.
25	Vampires infrequently travel more than 9 miles from their coffin, because this is the maximum distance they can travel as mist.
30	Many vampires have clan-specific powers, weaknesses, or traditions.
35	The PC learns a clan-specific trait for the clan being researched.
40	Vampire society is organized into a "Tree of Chains," in which the greater and elder vampires dominate a succession of spawn down to the newly spawned. To follow this chain to its head, clerics use <i>speak with dead</i> on destroyed newer vampires.

Chapter Eight

VAMPIRE

"WHAT? I DON'T COMPARE TO THE BEAUTIES OF CALIPHAS?" SHE DARED, HER COOL BREATH ON MY NECK, STARTLING ME WITH HER CLOSENESS.

IN TRUTH, SHE DIDN'T COMPARE. EVEN THROUGH HER ARRESTING VERMILION GOWN SHE WAS NAKED, HER BOLDNESS AND FIRE MAKING HER SO, NOTHING LIKE THE PRECOCIOUS, EMPTY-HEADED DEBUTANTES OF THE CAPITAL WITH THEIR PAINTED-ON FACES AND POISONOUS WHISPERS. HER INTENTIONS WERE OBVIOUS AND OVERWHELMING, AND WITH THE WOUND OF DURISTAN'S LOSS THERE WAS LITTLE I COULD DO TO RESIST THOSE EYES, THAT SKIN, THOSE LIPS. I TRIED TO MUTTER SOMETHING, BUT EVEN TO MYSELF IT SOUNDED LIKE NOTHING MORE THAN A MOAN OF CONSENT.

THE LAST THING I REMEMBER WAS GLIMPING THE GLOW OF JAUNDICED EYES THROUGH THE CRAZED SALON GLASS AND A FANGED SNEER THAT FOLLOWED ME EVEN INTO DARKNESS.

—AILSON KINDLER, *GALDYCE'S GUEST: FEAST OF THE NOSFERATU*

Priests often call death a release, a liberation from the bonds and concerns of life, allowing one to pass on into a state of rapture. In the vampire, such comforting words take on a terrifying cast, for once freed from the fears and cares of the living, only the basest hunger and unsatisfied lusts survive, desires that transform even the most virtuous souls into monsters.

Any discussion of vampires is one tainted by ages of lore and fiction, where superstition and fantasy muddle life-sparing fact. The truths of these horrors lie riddled with contradiction: vampires are dead, but live on; their bodies are cold, yet their beauty never fades; they sow suffering and death, yet they bear the faces of friends. While much is made of the ability of holy talismans, coffin dirt, hawthorne stakes, and sunlight to combat and destroy these undead, in practice there is no such thing as a common vampire, nor one that is not aware of its vulnerabilities and won't summon lifetimes of experience to continue its deathless rampage. Only an understanding of the goals and fundamental natures of these elusive undead might aid one in deterring their undying appetites, yet even then, all the resources of the living stand wanting when compared to the unnatural might and ages-old cunning of these princes of the undead.

NECROLOGY

Even given the wide range of folklore and legends in various cultures, few fail to possess at least passing knowledge of the vampiric cycle of predation and rejuvenation. While fireside tales do much to spread general details, such can hardly be relied upon when identifying one of these undead, and even less so when combating them.

The ultimate fear of vampires rises from their storied kiss, the bite and telltale marks that spread death and the dark curse of unlife. As the most discussed and feared power of these unliving hunters, vampires' pronounced fangs draw the blood of the living, allowing the vampire both to feed upon the vital fluid and, more terrifyingly, to create more of its kind from its victims. Though this is not an uncommon trait of the undead, in vampires such corruption finds refinement, affording them the choice of slaying their victims outright or resurrecting them, as either deathless thralls or true vampires. The distinctions between these similar abominations escape most would-be hunters, yet two distinct types of vampire exist: true vampires and vampire spawn (also known as vampire thralls, slaves, or brides). While details of true vampires dominate discussions of these terrors, the secondary vampire spawn is often entirely overlooked. These lesser yet still exceptionally dangerous vampires possess many of the strengths and weaknesses of their creators, yet lack true vampires' lordly domination over base creatures of the night, their power to transform into beasts, and their ability to create more of their kind. Typically, too, these spawn come from mortals without the willpower or

exceptional character that would attract vampires to remake them as peers rather than servants. Thus, vampire spawn are bound to the will of their masters, being slaves to their whims, typically exhibiting no more control or ambition of their own than feral ghouls or untamed hunters without the control and foresight of their masters.

Much mystery surrounds the properties of a vampire's bite, the fanged kiss through which they drain the blood of the living. Debates extend even unto the manner in which vampiric fangs aid in feeding, whether they merely serve as tools to start blood flowing or siphon blood themselves. Regardless of such particulars, the effects of a vampire's bite remain the same: gradual weakening unto death. While most vampires visit their victims night after night, draining them of their vitality little by little, some gorge themselves, drinking away an entire life in a single feast. It is from such deaths that new vampires might arise—though victims physically unfit for the transformation might still resurrect as mere vampire spawn. With such in mind, many vampires drain mortals near to death, but allow them to succumb to death from mere weakness and wasting, not the act of being drained directly. Thus, vampires choose who they pass their curse onto, avoiding the hindrances and evidence that multiple members of their kind sometimes present.

Draining blood is not the only way new vampires are created, however. Little known is the fact that the very touch of the vampire can drain one's power and weaken one's resolve—a condition that seems to be more a manner of fundamental deterioration than mere physical draining. Rarely used by vampires except in desperate conflicts, as it supplies them with no vital blood, their energy-sapping touch can easily extinguish a life, and from such withering deaths new vampires arise, cursing even the most exceptional souls to an existence as undead slaves.

The act of draining blood serves vampires as more than merely a method of creating new servants. Although none can truly say what drives these undead to thirst for blood, a vampire's lifelike appearance and the liquid source of mortal vitality are inseparably intertwined. Despite their own confessed need for blood, even unto nightly feeding, vampires held captive can seemingly go for months, even years, without drinking—yet the transformation this hunger causes is terrifying. Vampires deprived of blood gradually lose their lifelike appearance, withering into corpses ravaged to the extent time would naturally intend. In addition, the obsession with blood comes to dominate their starved psyches, driving them to the brink of madness and, in cases of extreme deprivation, irretrievably over it. Although their physical abilities seem unimpeded, their ravenous states cause them to forget much of the pomp and charm associated with their kind, revealing them for the nightmarish ghoul-kin they truly are. Those allowed to drink over the course of several nights regain their appearance and control, but the experience proves so physically and

psychologically painful—likened to dying again with every moment—that no vampire would willingly endure it.

Beyond the need for sustenance, vampires possess baser requirements to continue their undead existences. To rest, heal, and avoid the destructive properties of sunlight, vampires keep coffin sanctuaries. These resting places serve as a place for the undead to reconstitute if wounded and find a measure of the death-like repose they require to sustain their nightly hunts. All vampires have a unique connection with their coffins, preventing any common wooden box from sustaining them. Such a resting place must hold a personal connection for its user, typically being the coffin it was interred within, that of a family member, one that bears the grave dirt of its homeland, or a perfect facsimile of a lost coffin. Should its coffin be destroyed, a vampire goes to great lengths to find or create a new one that satisfies its deathly needs. Exactly what such needs are, however, varies between individuals, and only a tenacious hunter might reveal the specific mystery of a vampire's resting place.

The powers and methods of destroying a vampire also vary widely, both among individual vampires and in tales of these creatures. These undead are often described as holding power over vermin and nocturnal beasts, summoning such creatures forth and transforming into their shapes, or even discorporating into creeping mist. More exotic reports even tell of vampires controlling the weather, spreading disease, or taking on the appearances of living individuals. Such abilities and mastery of form make these undead notoriously difficult to detect, track, and defend against. Those who must, however, are confronted with equally varied advice on these menaces' vulnerabilities, ranging from wooden stakes through the heart to the abjuring properties of certain plants. Although no weakness can be called universal, most vampires truly are scorched by sunlight, weakened by rushing water, and immobilized—but not vanquished—by a stake through the heart. Yet even these supposed truths cannot be relied upon in every case, as vampires make for cunning, adaptable, and varied opponents. Typically, a vampire's weakness lies within its own history, and while the accounts of successful vampire hunts might suggest tools and practices to prepare those who would combat these horrors, in truth, little besides a patient mind, tenacity in the face of terror, and the grace of the gods can assure a vampire's final destruction.

HABITAT & SOCIETY

Just as the facets of the vampiric mindset defy reliable generalization, so too do details of their nightly habits. Perhaps the sole truth that applies to all vampires is their fundamental difference from other undead. While lingering souls and unquiet corpses typically tarry in haunts forsaken by the living, vampires seek out avenues coursing with vitality, their existences sustained by robbing life from the living one sanguine splash at a time. Thus, just as vampirism

might be likened to a disease, vampires plague mortal civilization, following, feeding upon, and spreading through it wherever it might arise. Typically, vampires prefer to hunt within sizable urban centers where they might blend in and their depredations might be disguised. Smaller communities can rarely satisfy a vampire's hungers, and feeding upon or driving away all the residents of an area serves these predators no better than a farmer who consumes his entire harvest before winter. As such, all but the most feral vampires strive to exercise subtlety and self control when it comes to their nightly feasts, so as not to deny themselves future prey. Only in the rarest situations might a vampire be able to exist in seclusion, and typically only then with complex arrangements to provide them with the endless stream of living blood they require.

In their interactions, either with the living or others of their kind, vampires prove just as likely to parody what they remember of mortal relations as to abandon such conventions entirely. Such translates into the manner in which these terrors hunt, either hiding as serpents within the shadows of mortal society, or prowling like wolves at the edge of civilization, picking off the weak and unwary who cross their paths.

In the case of vampires who infiltrate the streets and shadows of their former homelands, many go to great lengths adhering to what they perceive as the height of their chosen culture's society. In their undead egotism, most remake themselves as aristocrats or other elite, allowing themselves to hollowly enjoy in death what petty comforts they relished or longed for in life. In their socialization, such vampires wear the facade of dignity and culture, many becoming quite adept at passing as obscure nobility through centuries of such mimicry—though their manners often seem outdated or from another time. Yet even such etiquette merely serves as a mask, a pleasing visage that, when exposed by hunger or rage, reveals the unnatural predator within.

At the other extreme, many vampires completely divest themselves of their past mortality, letting all suggestion of reason, patience, and presentation drop away. While some continue to exist merely for themselves, becoming lords of their own private worlds, others lack the ambition or desire to master even themselves, degrading into little better than beasts, driven on only by their nightly hungers.

Which path a vampire chooses to spend its immortality pursuing varies largely depending on its psyche in life. Most fail to acclimate to their unliving states, especially those turned to undeath against their wills. Individuals with hearts and mindsets too virtuous or rigid to survive by feeding upon their former families and neighbors often starve, murder themselves, or go insane, rampaging until their hungers or conspicuousness destroy them. Such crazed undead might be pitiable, but rarely does any vestige of their former mortality survive, granting such terrors merely additional masks behind which to hide their monstrous hungers.

With powers godlike in comparison to those they possessed as mortals, most vampires are arrogant to the extreme. Such extends to their interactions with both the living and the dead. As such, vampires rarely fraternize with one another except in a master-slave arrangement. Should two vampires meet by happenstance, differences of personality and methodology typically predispose these undead to rivalry if not barefaced loathing. Should two vampires manage to overcome their initial distaste, seeing their own hungers reflected in another typically leads to deep-seated revulsion, both for their companion and themselves, which might only be satisfied by distance, or better, destruction. Thus, only when a vampire can look upon others of its kind as inferior servants, masters to replace, or evils to temporarily suffer might such abominations survive one another.

CAMPAIGN ROLE

With their innate strength, powers of manipulation, and elusive natures, vampires easily find their ambitions leading them into a diverse array of nighttime plots. While many monstrous creatures have limited possibilities for lairs and menace, vampires offer great range with both their variety of forms and their ability to hide among the living. When considering how to introduce vampires into a campaign, the GM should choose which form he wishes these undead stalkers to take, the most typical options being hunter or mastermind.

As hunters, vampires take the form of predators classically found in folklore, corpses driven by their lust for blood to prey upon the living. Both vampire spawn and full-fledged vampires fill this role well, hunting the living with either bestial savagery or the cunning of an ancient assassin. In most such plots, survival motivates these deathless killers, their predation either blatantly suggesting the modus operandi of their kind or being intentionally disguised and thus mysterious. The mere revelation of a vampire within a community's midst easily flows into a hunt for the creature's identity and subsequent slaying, drawing elements of urgency and mystery into any campaign. GMs might tailor the resulting evidence to the personality and goals of their vampiric villains, leading their PCs into the chateaus of sinister recluses, the haunted ruins of supposedly dead families, or even the forgotten warrens of feral vampiric clans.

As masterminds, vampires might become as deadly and varied in their goals as any other high-powered monster or villain. The type of creature a vampire was in life and the skills it possessed often color its plots in undeath: a warrior turned into a vampire might still attempt to bring ruin by the sword, while a vampiric wizard might prove as magically adept and knowledge-hungry as any lich. By warrant of their variety, true vampires better fulfill the role of schemer and manipulator than their more feral spawn. When in such a role, a vampire's hungers are typically secondary to their greater

plots, and as such, these needs are less likely to be given away, often fulfilled quietly or by the hands of a subordinate. Thus, only once a party is well invested in combating the depredations of such a villain might they come to realize his accursed nature.

VAMPIRIC BREEDS

Unlike the appellations of many undead, the name "vampire" can apply to a wide variety of terrible creatures, this

undead affliction proving variable to such an extent that numerous distinct types of vampires reputedly exist. While these unusual vampires might pervade the tales and fears of secluded or exotic regions—and even outnumber more typical vampires in such areas—they are generally far more reclusive than their better-known and more populous cousins.

Aswang: A terrifying breed of vampire typically haunting lands of the distant east, aswangs only arise from female victims. While these cunning undead predators fear no light and appear relatively human by day, they possess significant shapeshifting powers, undergoing a monstrous transformation, in which they grow terrible wings, claws, and a long, sharp tongue which they use to feed upon flesh and hearts—especially those of the young or unborn. Seemingly related to these grotesque undead are the dismembered *manananggal* and *penanggalan*, horrifying vampiric witches that respectively abandon their lower bodies or all but their heads and dangling entrails as they take to the hunt.

Dhampir: Known as ghoul-blooded or half-vampires, those cursed to live as dhampirs know a miserable half-life. Born from mothers infected with vampirism in the final days of their pregnancy or sired by freshly spawned vampire fathers, dhampirs live with the curse of vampirism in their mortal blood. Although the taint grants these rare souls eerie abilities, such as sensing nearby undead, so too are they cursed with a measure of their accursed parents' ravenous natures, making many just as dangerous as vampires themselves. (The dhampir appears in the *Pathfinder RPG Bestiary II*.)

Nosferatu: Thought by many to be bearers of an ancient strain of vampirism, nosferatu possess many traits common to vampires, yet notably lack the immortal youth and vigor of other breeds. With strange similarities to and powers over beasts and vermin, these reclusive, withered vampires typically avoid interactions with the living except those who fall victim to their eerie powers of mind control. Yet, despite their age and dreadful manipulations, nosferatu are a waning breed,

with none known to be able to pass on their monstrous curse and thus create more of their kind. (Nosferatu are described in detail in *Pathfinder Adventure Path* volume #8.)

Vrykolakas: Bestial creatures, vrykolakas lack all the pride, romanticism, and seductive qualities of other vampiric breeds. Similar to ghouls yet far more cunning, these animalistic, shape-changing corpses rise from their graves by night to haunt the living and spread a terrifying, life-draining disease. Bereft of numerous vampiric weaknesses, they prove notoriously difficult to kill and can easily scour the life from overconfident hunters or entire unwary communities. (The vrykolakas appears in *Pathfinder Adventure Path* volume #29.)

VARIANT VAMPIRIC ABILITIES

Just as various breeds of vampires exist, so too does diversity exist within regional or otherwise related groups of such undead.

Ancient Youth (Su): A vampire with this ability transformed into one of the undead at a very young age, and has been trapped within an adolescent body for an existence possibly measuring in centuries. Vampires with this ability are size Small and gain a +4 bonus on all Bluff checks. (+o CR)

Mastermind (Su): Vampires with this ability can have a number of enslaved spawn totaling four times its total Hit Dice. In addition, the vampire chooses one of the following three abilities: clairaudience, clairvoyance, or telepathy. Depending on the ability chosen, the vampire can hear what its spawn hears, see what it sees, or communicate telepathically with it. The vampire may exercise or end its use of this ability as a standard action and maintain its connection to its spawn for as long as it wishes. A vampire may only use this ability with one spawn at a time. The vampire and vampire spawn must be on the same plane for this ability to function. While using this ability, the vampire enters a catatonic state similar to its daily rest and is treated as helpless, though it is alerted to any jarring noises, the presence of any visible creature within 5 feet, or any damage that befalls its body. (CR +o)

Noble Dead (Su): A vampire with this ability possesses an ancient and legendary bloodline. He gains a +2 bonus on all Diplomacy checks, which increases to +4 if being utilized against another undead creature. In addition, he gains channel resistance +6, and the DC of his dominate ability increases by +2. (CR +o)

Sunlight Resistance (Su): This ability provides a vampire a measure of resistance against sunlight. On the second and all later rounds of exposure to direct sunlight, the vampire takes damage equal to one-third of its maximum hit points and is destroyed if this brings it to 0 hit points. The vampire is staggered on any round it is exposed to direct sunlight. (CR +o)

Swarm Form (Su): As a standard action, a vampire with this ability can change into a bat swarm, centipede swarm, rat swarm, or spider swarm. The swarm has a number of hit points equal to the vampire, and any damage done to the swarm affects the vampire's hit point total. While in swarm

form, a vampire cannot use any of its natural or special attacks, although it gains the movement, natural weapons, and extraordinary special abilities of the swarm into which it has transformed. The vampire also retains all of its usual special qualities. While in swarm form the vampire is still considered to be an undead creature with its total number of Hit Dice. A vampire can remain in swarm form until it assumes another form or retakes its original form (a standard action), or until the next sunrise. (CR +o)

KNOWN VAMPIRES

Untold populations of bloodthirsty undead hunt Golarion by night. Noted here are but two of these undying predators.

Galdyce: The aged viscount of the Ustalavic county of Amaans long sated his lusts among the peasantry of that mountainous region, claiming bride after ill-fated bride in a supposed attempt to father a male heir. Revealed as a nosferatu, Galdyce was supposedly slain in 4685 by the adventurers Duristan Barlhein and Ailson Kindler, leaving the Vale of Red Breath and the nearby village of Sen's Pass to return to a sleepy existence. In recent months, though, mysterious lights have been spotted among the half-ruined Castle Galdyce, leading many to fearfully whisper that the dreaded viscount or one of his terrible brides have returned home.

Jhalhasef: The Merchant of Life serves as a broker between the traders and alchemists of Merab and the ghouls of Nemret Noktoria in the Darklands deep below Thuvia. The dark-robed vampire seeks out dread secrets among the ghoulish scholars, trading them to the surface for prices paid in gold bars, amphoras of human blood, and veiled wagons bearing moaning cargo.

SAMPLE VAMPIRE

Few could conceive of a more charming, high-spirited pair than the aristocratic artist Lady Lauris Sankairn and her lifelong friend and bodyguard Audbrey Aldamori. Supposedly the last heir of a tragically small Galtan family, Lauris claims to be touring the finest cities of Taldor, Andoran, Cheliax, and points beyond in indulgence of her life-loving, adventuresome spirit. The pair have become popular additions to many a posh social circle, proving adept at art, drink, song, and whiling away evenings with tales of scandals and misadventures past. Despite their charm, the doting couple—quick to note their not wholly platonic yet still welcoming relationship—have greater goals than merely an endless stream of freewheeling revels. In truth, Lady Lauris is the vampiric spawn of Aldamori, a vampire who had preyed upon the aristocrats of Galt for centuries. With the coming of the Red Revolution, though, the vampire found much of the noblesse—the only mortals he deigned to dine upon—carted off as fodder for the guillotines. After abandoning the country, he and his most beautiful slave have continued to tour the Inner Sea under the guise of avant-garde fops for over 40 years, sampling the elite of numerous counties and leaving a trail of misfortune in their wake.

SPECIAL ABILITIES

Blood Drain (Su) Aubrey can suck blood from a grappled opponent; if he establishes or maintains a pin, he drains blood, dealing 1d4 points of Constitution damage. Aubrey heals 5 hit points or gains 5 temporary hit points for 1 hour (up to a 145 temporary hit points) each round he drains blood.

Change Shape (Su) Aubrey can use change shape to assume the form of a dire bat or wolf, as *beast shape II*.

Children of the Night (Su) Once per day, Aubrey can call forth 1d6+1 rat swarms, 1d4+1 bat swarms, or 2d6 wolves. These creatures arrive in 2d6 rounds and serve him for up to 1 hour.

Create Spawn (Su) Aubrey can create spawn out of humanoids he slays with blood drain or energy drain. The victim rises from death as a vampire in 1d4 days. This vampire is under Aubrey's command and remains enslaved until its master's destruction. Aubrey may have enslaved spawn totaling no more than 26 Hit Dice; any spawn he creates that would exceed this limit become free-willed undead.

Aubrey may free an enslaved spawn in order to enslave a new spawn, but once freed, a vampire or vampire spawn cannot be enslaved again.

Dominate (Su) Aubrey can crush a humanoid opponent's will as a standard action. Anyone he targets must succeed on a Will save or fall instantly under his influence, as though by a *dominate person* spell (caster level 12th). The ability has a range of 30 feet.

Energy Drain (Su) A creature hit by Aubrey's slam gains two negative levels. This ability only triggers once per round, regardless of the number of attacks Aubrey makes.

Gaseous Form (Su) As a standard action, Aubrey can assume *gaseous form* at will (caster level 5th), and can remain gaseous indefinitely, with a fly speed of 20 feet and perfect maneuverability.

Shadowless (Ex) Aubrey casts no shadows and shows no reflection in a mirror.

Spider Climb (Ex) Aubrey can climb sheer surfaces as though under the effects of a *spider climb* spell.

Chapter Nine

WALKING DEAD

"YOU WANT TO DIG A GRAVE GOOD AND DEEP, SO'S THEY DON'T HAVE TOO EASY A TIME CLIMBING BACK OUT. AND MAKE SURE THAT COFFIN'S NAILED TIGHT BEFORE YOU DROP IT IN. HARDWOOD'S BEST, GOOD OAK OR CEDAR, BUT MOST FOLKS'LL WANT TO SAVE A FEW COPPERS AND JUST GO WITH PINE. I'D SAY MORE THAN HALF THE WALKING DEAD IN THESE PARTS CAME OUT OF SHODDY COFFINS AND SHALLOW GRAVES, BUT WHAT CAN YOU DO? NOW IF YOU SEE ONE OF 'EM WANDERING AROUND, DON'T LOSE YOUR WITS. THEM ZOMBIES'RE USUALLY PRETTY SLOW, AND A GOOD WHACK OR TWO TO THE SIDE OF THE HEAD WITH A SHOVEL'LL USUALLY PUT 'EM DOWN AGAIN. O' COURSE, IF IT'S ONE OF THE FAST ONES, THERE'S NAUGHT ELSE TO DO BUT RUN AND HOPE YOU'RE FASTER THAN IT IS. HOW FAST YOU THINK YOU ARE, BOY, EH?"

—EFRAM GALL, GRAVEDIGGER, TWISTED TREE NECROPOLIS

G rinning skulls of bleached bone. Empty eye sockets aglow with pale, unholy light. Slack masks of rotting flesh, devoid of human emotion and intelligence. These are the faces of the walking dead, clattering skeletons come to life and corpses risen from the grave, shambling mindlessly forward, hungry for human flesh.

Skeletons and zombies are the most simple, and therefore the most widespread of all the undead. Little more than dead bodies animated through foul necromantic rituals, skeletons and zombies are usually just unthinking automatons, mindlessly following their creators' commands. Fearsome exceptions do exist, however—skeletons and zombies who have somehow managed to retain the intelligence and cunning to fanatically wage war against the living.

The walking dead normally serve as the simple tools of evil priests and wizards who have animated cadavers through the use of spells such as *animate dead*. While most skeletons and zombies are the products of such necromantic magics, other methods of creating the walking dead have been recorded. Rare alchemical concoctions can rot the flesh or melt it from bone, and give the corpse some semblance of life. Certain powerful curses can also cause a person to rise as a zombie upon death, often to take revenge on those still living.

However, skeletons and zombies have also been known to arise spontaneously, usually as a result of another powerful undead creature nearby. Certain areas with a strong necromantic aura or a history of killing—such as battlefields and long-forgotten sacrificial altars—or places where a significant number of people have died violently, as with a mass grave or the sites of massacre, can spontaneously produce the living dead as well. Undead generated by such processes are masterless and follow no commands, though they may display an instinctive ability to work together or with more intelligent undead, at least as far as their simple consciousnesses can comprehend.

NECROLOGY

An animated skeleton looks exactly like the skeleton of the creature it was in life, completely stripped of all muscles, organs, and flesh. If a corpse is animated as a skeleton, all of the flesh falls from its frame, leaving just bare bones. In some cases, the skeleton's empty eye sockets glow with a pale, sickly light. Beyond that, there can be considerable differences in the appearance of skeletons. The bones of newly created skeletons may shine white and smooth, while those of older skeletons are often cracked and yellowed with age. Zombies, on the other hand, keep the flesh on their bones, but it often festers and rots, becoming chunks of putrescence that eventually fall from their bodies.

Skeletons are surprisingly quick, and some still bear broken armor and weapons. In contrast, most zombies are sluggish and slow, but incredibly tough, and rely on their

fists to bludgeon opponents. Both types of walking dead are difficult to hurt—swords do little against the hardened bones of skeletons, while bludgeoning and piercing weapons have little effect on a zombie's decaying flesh. These undead monstrosities typically ignore wounds that would kill a human, and must literally be dismembered before the negative energy animating them dissipates.

The walking dead have little impact on their environment, unless ordered to scour an area by their creators. Although unintelligent, they do seem to possess an instinctive hatred for the living, and usually attack even if not given the order to do so. As undead, skeletons and zombies have no need of food, but unsettling reports continue to surface of zombies devouring the brains of those they kill, though the reasons behind such disturbing behavior are not clear.

HABITAT & SOCIETY

Zombies and skeletons frequently inhabit the same environments they did in life, although they are most commonly found in crypts, tombs, ruins, graveyards, and necropolises. Cheap and relatively easy to create, the walking dead are often used by evil necromancers to guard their lairs, and are a regular feature of evil temples, particularly those dedicated to gods of death. An overzealous creator may end up with more undead than he can control, resulting in "wild" undead that roam far from where they were created.

As mindless corpses, skeletons and zombies possess no social structure. Everything they do is at their creators' whims. In the absence of a master, a solitary individual may claim territory of a sort—a single crypt or a short section of dungeon hallway—guarding it and attacking any living thing that trespasses. Zombies often congregate in packs, but this seems to be an instinctive hunting reflex rather than a conscious decision, as even when found together, the walking dead do not coordinate their actions or attacks.

Occasionally, a large mixed group of skeletons or zombies spontaneously arises, usually at the site of a particularly bloody battle or other scene of carnage. These armies of the walking dead, known as legions, are rolling catastrophes that massacre everything in their path. With no living master to direct them, the army's deceased generals often become skeletal champions, holding fast to their intelligence and leading the legion as they did in life. In some cases, they continue to follow the orders they were given while still alive, but more commonly they set out on a campaign of senseless slaughter and destruction. Living armies frequently prove no match for the relentless, untiring onslaught of an undead legion, which can devastate vast swaths of countryside, depopulating entire villages and adding the slain to their ranks. Fortunately, such spontaneous legions are rare occurrences, and usually disband of their own accord once their mindless fury has been spent, or when they have achieved whatever mysterious goal was the impetus behind their genesis in the first place.

THE NATURE OF EVIL

"Skeletons and zombies are evil, even though they are mindless. This is because undeath itself is a naturally evil force, just as fire is naturally hot. While life and death exist in a cycle, neither is inherently good or evil, for creatures must die to feed others and make room for new life, which in turn must die to make room for even newer life. Undeath, by contrast, is a perversion of the natural order; an endless state that is neither life nor death, and a power that only corrupts and consumes. Vampires and brain-hungry zombies cannot create new life or sustain other life, they can only destroy life and propagate their kind until the world is filled with undying predators and no prey. Even things built with the power of undeath are merely perversions and mockeries of life, whether an animate corpse or an intelligent palace made of bones.

"This is not to say that all necromancers are evil or the school of necromantic magic is inherently evil. Necromancy spells manipulate the power of death, unlife, and the life force—the magic of death and the magic of undeath are two different things. A *circle of death* spell uses the power of death to snuff out life, but it is no more evil than stabbing a creature with a sword. Some argue that magic is just a tool, and how a tool is used determines whether the act is good or evil, but a counterargument holds that some tools are specifically designed to be used for evil, like implements of torture. Worse, some tools are inherently evil, and want to be used for evil. If fire always burned the innocent and spared the guilty, fire would be evil. Undeath is an inherently evil source of power, designed to corrupt and destroy life for no purpose other than hatred and because it can. There are exceptional, intelligent undead that are not evil, just as there are extremely rare demons and devils who become good, but evil is the norm because their essence is evil."

—Dhauken Tor, First Speaker of the Wise Council of the Arcanamirium, Absalom

While the mindless undead themselves worship no gods, those who create them commonly venerate one of three unholy faiths. The Pallid Princess Urgathoa, goddess of disease and undeath, remains the most popular choice among necromancers, and many of her priests regularly create undead, particularly favoring plague zombies. Other necromancers pay homage to Orcus, the Prince of Undeath, demon lord of necromancy and the undead, though his cult is small in comparison with Urgathoa's. Finally, many necromancers seeking eternal unlife, as well as those few walking dead who have retained their minds, often follow the tenets of the Whispering Way in their quest to achieve the ultimate state of lichdom. Of course, the follower of any evil deity (or tolerant neutral one) may create undead, resulting in Abadaran vault guardians, Gorumite war-skeletons, and so on.

CAMPAIGN ROLE

Traditional humanoid skeletons and zombies are most frequently used as low-level minions, disposable enemies that heroic PCs can destroy without remorse or quarter. They offer little threat at higher levels, and are often easily destroyed by the channeled energy of a party's cleric. Used properly, however, the walking dead can be challenging opponents at all levels of play. Besides using variant skeletons and zombies with new abilities to surprise players, remember that other non-humanoid monsters can become walking dead as well. Skeletal champions mounted on warhorse skeletons, demonic or infernal zombies, skeletal dinosaurs come to life, giant zombie rocs, or even intelligent skeletal dragons might make for interesting undead opponents.

Large numbers of undead can be an additional challenge. A skeleton may have only 4 hit points, but when the PCs are all that stands between a horde of a hundred skeletons and the residents of a hapless village, they may not seem like such easy foes after all. A whole crypt or dungeon full of undead soon exhausts a cleric's channeled energy, requiring the PCs to come up with more inventive ways of overcoming the infestation of walking dead.

FACES OF DEATH

The simple, tottering skeleton and mindless, shambling zombie are the stereotypical image of the walking dead, but these undead horrors come in highly variable forms. Bloody skeletons, burning skeletons, fast zombies, plague zombies, and deadly intelligent skeletal champions are the best-known variants, but the walking dead are a diverse lot, and many more varieties might stalk moonlit graveyards and haunted crypts, each possessing its own strange and unique abilities. Although some common forms are listed below, in many cases these variant abilities may be applied to either skeletons or zombies, unless common sense dictates otherwise (such as a gasburst skeleton). Likewise, except as noted, the following variations can be stacked with one another—it's possible to have an exploding acid skeleton, for example.

Acid Skeleton: The bones of an acid skeleton constantly ooze caustic acid. An acid skeleton's melee attacks deal an additional 1d6 points of acid damage, and anyone striking an acid skeleton with an unarmed strike or natural attack takes 1d6 points of acid damage. Acid skeletons lose their immunity to cold but gain immunity to acid. An acid skeleton's Charisma is 12. Other energy types, such as electric skeletons or frost skeletons, can be applied in a similar fashion. (CR +1)

Alchemical Zombie: This zombie has been created through alchemical processes rather than necromantic magic. As such, positive energy has less effect on it, giving it channel resistance +2. Its alchemically treated flesh is also more resistant to damage, granting it an additional +2 bonus to its natural Armor Class above that which it gains based on its size. (CR +1)

Brain-eating Zombie: These terrifying zombie variants feed on humanoid brains. They gain a bite attack that deals damage based on the zombie's size, and the grab special attack, usable against opponents of the zombie's own size or smaller. When an opponent dies, the zombie uses its next turn to feast upon its victim's brain, making spells that require a complete corpse (such as *raise dead*) useless. Anyone killed after being bitten by a brain-eating zombie rises as a brain-eating zombie in 2d6 hours unless the corpse is blessed or similar preventative measures are taken. (CR +0)

Cursed Zombie: Created as the result of a powerful curse rather than through necromantic spells, cursed zombies can bestow a curse upon their victims. A cursed zombie gains the curse special attack, delivered with its slam attack. **Zombie curse (Su)** slam; *save* Will DC = 10 + 1/2 the zombie's Hit Dice + the zombie's Cha modifier; *frequency* —; *effect* as *bestow curse*; *cure* —. (CR +1)

Exploding Skeleton: Also called "bone bombs," an exploding skeleton detonates in a burst of razor-sharp bone fragments when it dies. Anyone within 10 feet of the skeleton when it is destroyed takes 1d6 points of damage per hit die of the skeleton (minimum 1d6). A Reflex save (DC 10 + 1/2 the skeleton's Hit Dice + the skeleton's Cha modifier) halves this damage. Bloody, burning, and multiplying skeletons cannot be exploding skeletons. (CR +0)

Gasburst Zombie: These bloated zombies are filled with toxic gas. When a gasburst zombie dies, it explodes in a cloud of noxious vapors which fill a 10-foot cube surrounding the zombie. Gasburst zombies are commonly filled with burnt othur fumes or ungol dust, but any poisonous gas may be used. Gas burst zombies have DR 5/piercing instead of DR 5/slashing. (CR depends on poison used, usually +1)

Host Corpse: This skeleton or zombie has been infested with a swarm of vermin or Tiny undead creatures that it releases from its body. Skeletal hosts often hold carrionstorms (see *Pathfinder Adventure Path* volume #2) or bat swarms in their rib cages, while zombie hosts frequently carry locusts or flesh-eating cockroach swarms (see *Pathfinder Adventure Path* volume #13) inside their rotting husks. Acid, bloody, and burning skeletons cannot be host corpses. (CR +0, with the swarm's CR counting as a separate creature)

Magus: These variant skeletal champions and zombie lords are minor spellcasters (typically 5th-level or less) that have retained both their intelligence and their spellcasting abilities. Magus skeletons and zombies gain Silent Spell as a bonus feat. (CR +1 plus caster level)

Mudra Skeleton: Sometimes known as "whirlwind skeletons," mudra skeletons are created with four or more arms, each capable of wielding a weapon. A mudra skeleton's Dexterity increases by +4 (instead of +2), and it gains Multiweapon Fighting and Weapon Finesse as bonus feats. (CR +1)

Multiplying Skeleton: This fearsome skeleton variant grows into more skeletons if destroyed. When a multiplying skeleton is destroyed, its bones reform 1d4 rounds later into two smaller multiplying skeletons with half the Hit Dice of the original. Each resulting multiplying skeleton continues to reform into smaller and smaller sizes. A Colossal multiplying skeleton splits into two Huge skeletons, a Gargantuan skeleton becomes two Large skeletons, a Huge skeleton reforms as two Medium skeletons, and so on, until the skeleton's Hit Dice can no longer be halved or the resulting skeletons would be Diminutive or smaller, at which point the skeletons are finally destroyed. Bloody, burning, and exploding skeletons cannot be multiplying skeletons. (CR +1)

Relentless Zombie: These have all the powers of fast zombies, and also gain a Climb speed equal to half the base creature's land speed, the scent special ability, a +4 racial bonus to Survival checks to track by smell, and two additional Hit Dice. (CR +1)

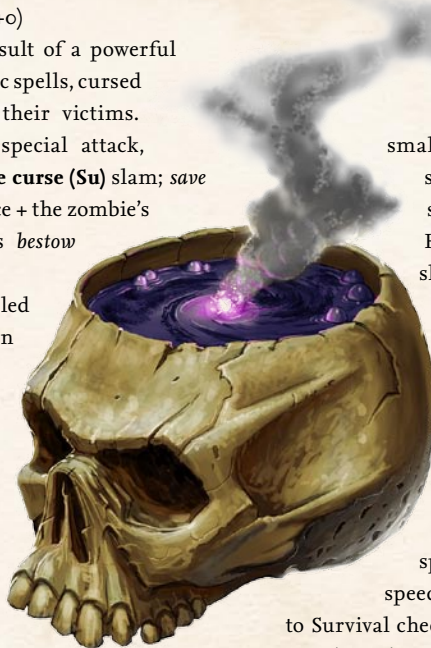

Skeletal Archer: While not as intelligent or skilled as skeletal champions, skeletal archers are nevertheless a welcome addition to any undead army. Skeletal archers gain Point-Blank Shot and Precise Shot as bonus feats. (CR +0)

Zombie Lord: Zombie lords are the fleshy counterparts to skeletal champions, rare zombies who have somehow managed to retain their intelligence. Use the normal zombie template for the zombie lord's Armor Class, base save bonuses, speed, melee attacks, base attack bonus, and damage reduction. Use the skeletal champion template for the zombie lord's Hit Dice, skills, and ability scores. Zombie lords gain channel resistance +4 and Toughness as a bonus feat. A zombie lord does not gain the staggered special quality. (CR as a zombie of the same Hit Dice +1.)

KNOWN WALKING DEAD

The following are some of the more notorious walking dead of Golarion.

The Army of Erlexian Thool: Known as the Sorcerer of Barrow Knoll, this tiefling necromancer claims to be the scion of a powerful Gebbite Blood Lord and the demon lord Zura, the Vampire Queen. Regardless of the veracity of such grandiose assertions, Erlexian is obsessed with all things undead. Driven

FACETS OF FEAR

As plague ravages a town and the bodies of loved ones, friends, and neighbors pile up in the streets, what could be more natural than the fear of those corpses somehow coming to life, rising from the dead to claim you as one of their own? Death is the great unknown, the one thing all people fear, and the concept of returning from such a state turns the hearts of men and women to ice.

In areas devastated by pestilence and disease, the dead can sometimes outnumber the survivors, leading to the fear that the walking dead will overrun the living in a “zombie apocalypse.” And as more people fall victim to the terrifying plague, the number of walking dead continues to increase. Civilization is a fragile thing, and in the face of such an unprecedented, unstoppable threat, can society truly hold itself together? Or is it doomed to fall beneath the claws and teeth of the dearly departed?

The fear of the walking dead is also the fear of becoming one of them—a mindless slave under the control of someone else. A person transformed into a zombie loses his freedom, his individuality, his conscience, and some might say his very soul. And not even death can save you from such a fate, because your final reward—a peaceful death and a heavenly afterlife—is also taken from you. Becoming a member of the walking dead means nothing less than a horrific, unending life without hope of rest.

from a succession of cities across Avistan for grave robbing and suspected murder, Erlexian now makes his home in a crumbling tower on the outskirts of the River Kingdoms village of Barrow Knoll. Having exhausted the supply of cadavers from the many surrounding tombs that give the village its name, Erlexian turned to the living inhabitants of the town, demanding each household supply him with one fresh body or face retribution. Fearing the powerful wizard within their midst, the terrified villagers had little choice but to comply. Barrow Knoll is now a gloomy, troubled place, almost deserted, as Erlexian's undead minions patrol the village every night, capturing anyone who strays out of doors in order to fuel their master's mania. Meanwhile, Erlexian concentrates on his depraved experiments, surrounding himself with zombie footmen and skeletal servants created from the village's unfortunate populace.

The Blazing Cavalier: Though his original name has been lost to history, the burning skeletal champion known as the Blazing Cavalier was once a hero of the Shining Crusade, a member of the famed Knights of Ozem. In one of the Knights' many battles against the Whispering Tyrant, the warrior was slain by the witch-king, incinerated in eldritch fire until nothing but charred bones remained. So dedicated was he to his cause, however, that not even death could stop the knight's righteous fury. His skeleton rose from where it had fallen, still burning, and he rejoined the fight. After Tar-Baphon's eventual defeat,

the Blazing Cavalier vanished into the Hungry Mountains, but reports of a flaming, armored knight patrolling the mountains and fighting orcs, undead, and other evil creatures have surfaced again and again over the centuries. Popular tales in Lastwall say that the Blazing Cavalier is waiting for Tar-Baphon's inevitable return, at which time the knight will face the Whispering Tyrant before the gates of Gallowspire one last time and slay the lich lord once and for all. Only then will the Blazing Cavalier crumble to dust, finally at peace.

The Gillamoor Plague: Following the Goblinblood Wars, many of Isgar's villages fell to fire or the sword. Gillamoor, near the charred eaves of the Chitterwood, was one of the lucky ones to survive that devastation, but recent reports from merchant caravans reaching Elidir bear disquieting news. Something evil has befallen the village of Gillamoor, and the normally fearless caravan guards of Druma's Mercenary League turn white-faced and trembling as they recount how the village's residents have apparently transformed from simple peasants into ravenous, undead monsters, fiendishly quick and devilishly hard to kill. Rumor now has it that Gillamoor has been quarantined, and that the Isgeri army is looking for volunteers to enter the village to end the threat.

Leylani Marakhoun: Fifty years ago, the young, beautiful, and narcissistic Gebbite aristocrat Leylani Marakhoun was horrified to see her beauty fading with age. A casual follower of the Whispering Way, Leylani decided to preserve her beauty by becoming a lich. Unfortunately, having dropped out of the Mortuary, Leylani's magical skills never surpassed those of an apprentice, and her amateur rituals only resulted in transforming her into a magus zombie, a rotten corpse with none of the power or prestige of a lich. No longer the popular socialite of her youth, Leylani now spends her days religiously applying *unguent of revivification* and other more mundane cosmetics in a vain attempt to stave off the decay of her disintegrating, putrid flesh. Insane with jealousy, Leylani has begun secretly murdering attractive young debutantes and animating them into ghastly, mindless zombies under her control.

The Sleeping Knights of Ras-Jajan: When the self-styled Necromancer-King Ras-Jajan attacked Absalom in 3692 AR, he and his undead army were soundly defeated. Although the would-be conqueror's body was never found, he left behind his fortress, one of the many siege castles littering the Cairnlands around the city. The sole survivor of an adventuring band that braved the depths of Ras-Jajan's Refuge reported seeing row upon row of skeletal warriors, archers, and charioteers in a vast chamber beneath the siege castle, armor and weapons in perfect condition, apparently waiting for their master's command to rise and march upon the city once again. Rightly concerned with the threat this undead legion poses, the Church of Pharasma sent two expeditions into Ras-Jajan's Refuge. When both of them failed to return, the Chamber of Ecclesiastics washed their hands of the matter, leaving Absalom's Grand Council and the Eagle Garrison to deal with the Sleeping Knights and the siege castle's many wards and guardians.

SAMPLE WALKING DEAD

The Iseri village of Gillamoor has been afflicted with a horrifying plague that is quickly turning the entire populace into mindless, ravenous zombies. Unknowingly carried by an itinerant Ustlavian peddler, the affliction spread quickly through the town, infecting nearly everyone who came into contact with it. The few surviving residents huddle fearfully inside their homes behind makeshift barricades, while the undead corpses of their former neighbors prowl hungrily outside in search of fresh brains to devour.

On the orders of the Steward of Iser, the Drumish merchant caravan who first brought word of the plague was slain to a man to prevent the spread of the contagion. Fortunately, Gillamoor sits well away from the vital trade routes of the Conerica Straits, so the authorities believe the plague is still constrained to the village itself. Already undermanned and underfunded, the Iseri army has been unable to do anything to address the problem, other than to post notices at crossroads that Gillamoor is under quarantine, and offer a reward of 5,000 gold pieces to anyone who can cleanse the village of infection. Of course, destroying over 500 zombies is no mean feat even for a skilled adventuring group.

GILLAMOOR PLAGUE ZOMBIE

CR 1

XP 400

Relentless brain-eating plague human zombie

NE Medium undead

Init +2; **Senses** darkvision 60 ft., scent; Perception +0

DEFENSE

AC 14, touch 12, flat-footed 12 (+2 Dex, +2 natural)**hp** 22 (4d8+4)**Fort** +1, **Ref** +3, **Will** +4**Immune** undead traits

OFFENSE

Speed 40 ft., climb 20 ft.**Melee** slam +6 (1d6+3 plus grab), bite (1d6+3 plus grab)**Special Attacks** brain-eating, create spawn, death burst, disease, grab, quick strikes

TACTICS

Before Combat Gillamoor plague zombies shamble about like normal zombies, only using their full speed if attacked or if they are in charge range of an opponent.**During Combat** A Gillamoor plague zombie focuses all of its attacks on a single opponent, attempting to bite and grab the victim to feed upon its brain. It pursues its chosen quarry until either the prey or the zombie is dead.**Morale** Gillamoor plague zombies fight until destroyed.

STATISTICS

Str 17, **Dex** 14, **Con** —, **Int** —, **Wis** 10, **Cha** 10**Base Atk** +3; **CMB** +6; **CMD** 18**Feats** Toughness^B**Skills** Climb +11, Survival +0 (+4 when tracking by scent)

SPECIAL ABILITIES

Brain-eating (Ex) After killing a target, the zombie uses its next turn to eat it's victim's brain. This prevents raising the body from the dead by any method that requires an intact corpse.**Create Spawn (Su):** Anyone killed after being bitten by a Gillamoor zombie rises as a Gillamoor zombie 2d6 hours later unless the corpse is blessed or similar measures are taken.**Death Burst (Ex)** When the zombie dies, it explodes in a burst of decay. All creatures adjacent to the zombie are exposed to its disease as if struck by a slam attack and must make a Fortitude save or contract zombie rot.**Disease (Su)** The zombie's natural attacks carry the zombie rot disease. *Zombie rot*: slam—injury; *save* Fort DC 12; *onset* 1d4 days; *frequency* 1/day; *effect* 1d2 Con, this damage cannot be healed while the creature is infected; *cure* 2 consecutive saves. Anyone who dies while infected rises as a Gillamoor zombie in 2d6 hours.**Quick Strikes (Ex)** Whenever the zombie takes a full-round attack action, it can make one additional slam attack at its highest base attack bonus.

BIRTH OF THE DEAD

Origins of the Walking Dead

BY ARI MARMELL • ILLUSTRATED BY JEFF LAUBENSTEIN

DUNGEONS & DRAGONS boasts an astounding number of undead, some from ancient myth, others from the fiendish imaginations of the game's creators. It can be difficult, however, to justify so many different varieties in a campaign world. Unlike other monster types, undead do not procreate in the traditional sense. They are created either through necromancy or some terrible deed. It's fairly easy to imagine how a wight, ghoul, or ghost might arise, but what could cause a body to rise as a night-walker? A boneclaw? A devourer?

This article offers a brief look at most of the undead from the *Monster Manual* (omitting only skeletons and zombies, mindless undead who exist only as puppets), and a selection of undead from other bestiaries. Each entry covers what conditions generally lead to the creation of that particular undead, as well as mentioning the traditional methods (such as through an attack and by spell). Although the deities mentioned below are specific to the core D&D setting, they are easily replaced with comparable gods in *EBERRON*, the *FORGOTTEN REALMS*, or any other campaign.

Allip

Tezra sobbed silently as the rusty razor slid across her wrist. It rasped as it cut, but at least the sound drowned out the voices. It was only a momentary respite. She felt her life drain slowly from her wrist and she knew as she stared up at a ceiling that the voices would never trouble her again.

Then she was looking not up at the ceiling, but down at her bloodless, tear-streaked face. Tezra floated up and back, through the walls of her tiny home, her sobs turning to manic laughter none would ever hear. She would no longer suffer from the voices. She had become one.

It's no wonder that undead are often cruel, for undeath itself seems to possess an innate sadistic streak. How else to explain that those who have arguably suffered most should find their agony prolonged even after their last attempt to end it? The allip is the spirit of someone driven to suicide by madness, yet even death cannot quiet the madness that afflicts it. Some suggest that the allip is not truly hostile at all, but simply cannot understand that it only harms those to whom it reaches out for help in its lingering, lifeless confusion.

Suicide need not be the individual's conscious goal, so long as it can be directly attributed to the insanity. For instance, someone who jumps from a tower out of depression qualifies, but so does a madman who perishes after gouging out his own eyes in order to escape his hallucinations. Further, someone found shortly after death and offered a respectful burial is not likely to become an allip; only those who lie unfound for days or longer seem to linger as undead. Source: *Monster Manual*, page 10.

Bodak

"There are experiences worse than confronting demons," Jozan whispered to the tombstone by which he knelt. Only a date and name was carved upon it: Regdar.

"Like what, Jozan?" the soft voice of his elven companion asked from behind him.

"Burying your friends afterward." The cleric stood, and sadly brushed the dirt from his knees. "Come, Miale. It may not be very priestly, but I could use an ale or six."

The pair turned to leave, unaware of the subtle shifting of the dirt behind them, the faint scratching that heralded the rising of the body beneath the earth.

Oh, there were worse experiences than confronting demons, all right. Such as confronting the friends you thought you'd buried.

Bodaks are "the undead remnants of humanoids who have been destroyed by the touch of absolute evil." Typically this means that bodaks are created by other bodaks through their death gaze, but other methods exist as well.

More than just undead, bodaks are slightly fiendish as well. A bodak might rise when an outsider with the evil subtype slays a humanoid creature with negative

energy, a necromantic spell, or a death effect. The responsible fiend gains no control over the bodak, but few fiends take objection to unleashing yet another uncontrolled evil upon the world. Source: *Monster Manual*, page 28.

Bone Naga

"Is this something we're going to have to worry about?" Regdar asked, pointing to the serpentine skeleton draped over the altar. He glanced down toward the fresher corpse at his feet and scowled. "We barely beat a living naga. I don't want to face an undead one."

"I think not," Naull told him, examining the ancient runes carved into the chamber's walls. "I'm no necromancer, but I know something about death magic. There's no way this naga was strong enough to cast the necessary spells."

As if in response, the skeletal monstrosity raised its head with a sepulchral rattle.

Bone nagas are created from, and usually by, other nagas (most frequently dark nagas). Dark nagas know of a ritual to create a bone naga using *animate dead*. The ritual requires numerous components, including the ocular fluids of a divine caster and a sentient reptile. These can come from the same creature, if appropriate. Only taught to dark nagas, this rite contains a number of special somatic components that humanoids cannot emulate.

It is rumored that some free-willed bone nagas also possess the ability to perform the creation ritual and actively seek out their living brethren, enslaving them in undeath. Source: *Monster Manual II*, page 35.

Boneclaw

Ember struggled against the spell that held her, but to no avail. To have entrapped her so completely the spellcaster must be powerful indeed, for her body and mind were trained to shrug off such magics.

She could see little of the chamber. The walls flashed red in the light of a nearby fire, and she could see the legs and lower torso of the fiendish hag she had just slain.

"I should thank you, noble warrior." The voice behind her was cold, fireless. "You have brought to me everything I need. I could not have done this without you."

A small horde of tiny creatures—wererats, Ember realized—scurried into sight and set about stripping the flesh from the hag in long strips, their bright knives glinting in the firelight. When they set about stripping Ember's flesh from her, beginning with her hands—hands that could shatter stone—Ember couldn't even scream.

Created as an immortal weapon, only the most abominable rituals birth boneclaws. The rite calls for the skeletons of Large, magic-using, humanoid-shaped creatures (such as ogre magi and certain types of hags). It infuses them with negative energy, strips them of most of their remaining flesh, and grafts additional bones to their body—mostly around the fingers. These additional bones must be cut from the flesh of living victims.

This rite requires the spells *create undead* (caster level 15+) and *greater magic fang*. Druidic magic is essential to the ritual, making boneclaws exceptionally rare even compared to other created undead. Source: *Monster Manual III*, page 17.

Charnel Hound

In a wave of destruction, dirt erupted from a hundred graves and then a hundred more. From each crawled the corpse that dwelt within, propelled by a malignant will. Naked skulls and fleshy visages seemed to gape open in horror as they dragged themselves in a mockery of infancy. Where they met their joints shattered and their bones clenched to one another. In the mass of writhing decay, a dog-shaped figure began to form.

The first charnel hound formed from the corpses of one particular cemetery, located behind a secret shrine to Nerull the Reaper. Seeing the horrific beast in action, necromancers determined to develop charnel hounds of their own. Early

tests resulted in uncontrollable horrors (to say nothing of the deaths of many of the experimenters), but sadly, they finally succeeded. No longer the province of deities alone, mortal spellcasters have unlocked the secrets to charnel hound creation.

The ritual requires 200 corpses, the spell *create greater undead* (caster level 20+), and unholy unguents worth 15,000 gp (in addition to the standard components of the spell).

On occasion, charnel hounds arise without a mortal creator, spawned by the vile will of a deity even as the first such horror was created by Nerull. Source: *Monster Manual III*, page 26.

Crawling Head

"This is different," Gimble muttered to Henet, holding his torch high to stare at the strange icons carved into the wall. "Up to this point, it's all about mummification. We've seen that before, but look here!"

The sorcerer looked. The walls displayed primitive pictographs, but there could be no mistaking what they were meant to convey. Priests stood around a figure chained to an enormous slab. Scattered about him were the remains of numerous smaller beings. The chained figure thrashed while two priests stuffed strange items into his mouth and a third stood by fingering a saw-bladed axe.

"What in the name of all the hells were they doing here?" Gimble asked.

"I don't know," Henet told him, "but whatever it was, it happened beyond this next door."

The first crawling head was created deliberately years ago, constructed from the severed head of a hill giant by a necromancer later slain by his own creation. Since then, giant necromancers have adopted the practice of creating crawling heads, although some humanoids still do so as well. The rite requires *create undead* and the sacrifice of a giant who just fed on at least three sentient beings.

Unfortunately, crawling heads are notoriously free-willed. Every day, at sunset, there is a 1% chance of the head breaking free of its creator's control. Once lost, control can never be restored and the crawling head likely attempts to destroy its creator. Source: *Fiend Folio*, page 35.

Crimson Death

Lord Varvain shrieked as the stake penetrated flesh and cracked ribs. So great was the agony, he actually prayed that this one would kill him.

It did not. It slid through the vampire's torso and into the cypress on which he hung, missing his heart by inches—as had the previous stakes that even now held him aloft.

"You swore you would spare me." The voice was hollow and emotionless. It echoed from a swirling mist, pink-tinged, that might once have been the face of a beautiful woman. "Then you swore you would change me, to be as you are. You should have kept your promise."

"Please..." The great vampire lord, scourge of a dozen villages for half as many decades, could only whimper. "Kill me..."

Varvain shrieked once more as the stake punctured his stomach, nailing him ever more tightly to the tree.

"Perhaps tomorrow, my 'lord.' First, I think you should watch me feed."

Legends tell that a crimson death is born from the destruction of a strong-willed vampire. This is not, in fact, the case. Crimson deaths might form from anyone who dies via exsanguination and whose body is then consumed or destroyed. A traveler in a marsh sucked dry by leeches and then consumed by other swamp creatures might rise as a crimson death. Similarly, a vampire who drains a victim and then cremates the body to prevent it from rising as another vampire might provoke the manifestation of a crimson death. The same hatred and iron will required to create ghosts

or wraiths is necessary for the formation of a crimson death. They favor swamps and other misty regions due to their ability to easily hide in such environments, and not due to any necrological aspects of their condition. Source: *Monster Manual II*, page 53.

Death Knight

"Foul Lord of Brine, Ravager of Worlds, hear the call of your faithful, degenerate servant." He knelt before the two-faced idol, its twin tentacles on either side of his head. His black armor weighed heavy upon him, and he could hardly hear his own prayer for the sounds of battle. He heard Alhandra's voice and knew he could not defeat both the paladin and her companions.

Yet although he prayed, great Demogorgon sent no sign.

With a shout of rage, he sent the idol skittering across the floor with the back of his fist and rose to fight his final battle. He knew not, as he stormed from the chamber, that the Prince of Demons had not abandoned him at all. No, Demogorgon had great plans for him—he just needed to die first.

Great warriors in life, most death knights are favored servants of evil, but some served the forces of good as paladins, tragically fallen from grace not long before dying. Most served archfiends, as opposed to evil deities, and in fact the demon prince Demogorgon is credited with creating the first such horror. Some warriors seek out the undead existence of the death knight, but a mortal cannot perform the ritual without assistance. The transformation requires the active assistance of a powerful fiend. On rare occasions, death knights occur spontaneously upon the death of a favored servant of an archfiend or evil deity. Finally, and even less frequently, death knights might arise as the result of a curse. If an innocent dies due to a fallen paladin's actions, that individual might pronounce a dying curse that results in eternal

unlife for the former champion of light. Source: *Monster Manual II*, page 207.

Devourer

Hennet did not know how long it had been since the thing that lurked in the endless Astral Plane had attacked him and Naull. He knew only it must have been a long time, because he was hungry. Oh, so hungry.

He looked down at Naull, felt her soul screaming from within him, screaming at him by name. He knew he should feel bad about what he'd done, but he couldn't remember why. He only knew that he was grateful to have found her, although already he wondered where he might find his next meal.

While devourers can be created deliberately by spellcasters using create greater undead, this is not the only way they manifest. If a humanoid traveling on the Astral Planer or Ethereal Plane is slain by a negative energy effect, she might rise again as a devourer. The combination of negative energies and the ambient forces of those planes combine into a mystic aura unlike any other, causing the body to warp and grow. The devourer becomes a permanent conduit to the Astral or Ethereal Plane, which constantly siphons off the negative energy animating it. Due to this effect the devourer starves if it does not absorb the lives of others. The deceased's physical body becomes the devourer, so the undead appears on the Astral or Ethereal Plane if the individual physically traveled there, but if projecting her Astral form, her physical body—and thus the resulting devourer—remains on the Material Plane. Source: *Monster Manual*, page 58.

Drowned

"Please, you have the cargo! There's no need to do this! Please!"

Allaris, unable to tell where his tears ended and the ocean spray began, cringed

against the cold metal of the anchor as the bearded pirate leaned over him, grinning a gold-toothed grin.

"There's every need to do this," he chortled, once more testing the ropes that bound the merchant to the iron weight.

"Gods, why?"

"Because it's fun."

Allaris screamed as the anchor dropped, choking as the seawater flooded his chest. Then it was his lungs that screamed, but they too eventually stopped.

Clearly, not all who drown become undead. Drowned appear when people perish beneath the waves specifically due to the actions (or negligence) of others. A ship that sinks due to storm damage does not transform those onboard into drowned, but one that sinks because of sabotage or pirates might. The earliest drowned formed when an entire island sank

because of the foolish efforts of a powerful mage to enslave the sea god, and it is his curse that continues to form these undead today. Source: *Monster Manual III*, page 46.

Effigy

"It is done." Father Benedict turned to face the gathered crowd, most of whom still stared at the gruesome figure tied to the smoldering stake. "She has been purified, cleansed by the divine flame. No longer shall her vile witcheries bedevil our town. We are safe once more."

Benedict laced his fingers and smiled benignly at the townsfolk as they filed from the square. The harlot had been no witch at all, but her sacrifice would buy him time to deal with the real culprit without his people turning on him. His position was secure, and he—

From the charred wood, a skeletal hand thrust forth, wreathed in flame, to wrap dead fingers around Benedict's neck. No, the woman had been no threat to Benedict, no threat to the townsfolk.

Until now.

Like so many undead, effigies form from the hate and rage of a dying individual. Such people must die under circumstances wherein they believe they have been deprived of their rightful due by the actions of others. For example, someone murdered on the verge of completing a major ambition or gaining a windfall might become an effigy. In addition, an effigy can only form if the individual died by fire, such as a fireball or flame strike spell, or a dragon's breath. This factor, far more than any other, explains why ghosts are more common than effigies. Source: *Monster Manual II*, page 89.

Famine Spirit

He could feel himself dying.

The filth stung his wounds, making them fester, yet he dared not leave the shelter of the sewer. The guild still sought him, would kill him to prevent him from revealing what he knew. If only he had refused to help them—but the riches they'd offered were so great and he had so little.

Another day. Just another day and they would have moved on to some other district. Another day, and he could leave these accursed sewers and start anew somewhere else.

He didn't know he had been telling himself "just another day" for weeks on end. He didn't know that he was long dead, dead of starvation and want. He didn't know that when he finally found the strength to walk again, it would be as something utterly inhuman.

Not everyone who dies of hunger becomes a famine spirit. Specifically, someone must spend much of his life hungry or otherwise wanting for basic necessities. Potential sources include people living in poverty or who dwell in famine-prone areas. The individual must, near the end of his life, have had the opportunity to raise himself from his current state, perhaps to acquire riches or move to more fertile lands. This

chance must be snatched away by the actions of another person or sentient being, thus causing the individual to perish not only of starvation but also of frustration and cruelly shattered hopes. Only when all these conditions are met, a truly strong-willed individual becomes a famine spirit. Source: *Monster Manual II*, page 96.

Ghast

The first had been legitimate. After the fifth week of being stranded in the damned mountain pass one of them had to go or they'd all have died. The taste had awakened something in him. The second, the third, the fourth—they didn't have to die. The band could have waited another few weeks before making that decision again.

Unfortunately, the others had found him leaning over his sister's body, chewing the flesh from her bones. He'd never even had the chance to raise his head before the smith had crushed it with a hammer.

Rising later that night, he found that death hadn't done a thing to dull his new-found hunger.

The best-known methods for creating a ghast are through create undead and by contracting ghoul fever. A third method exists, however. If someone who might spontaneously become a ghoul at death dies while actually in the process of consuming humanoid flesh, he instead rises as a ghast. Like their lesser cousins, ghouls are a literal manifestation of cannibalism. While ghouls often consume their prey alive simply because it's expedient to do so, ghouls actively enjoy the torment and horror caused by the slow consumption of a conscious victim. Source: *Monster Manual*, page 119.

Ghost

"Mister, can you help me?"

Regdar stopped and peered in through the open doorway. He couldn't see much in the darkness beyond, but the voice

was clearly that of a little girl. "What's wrong, kid?"

"I went to tell Mommy I was feeling better, but something's wrong. I can't reach her, and she won't wake up when I call."

The old fighter's heart sank. This kid had probably just lost her mother, and didn't understand. Still, maybe the woman was alive, maybe he could bring her to the temple in time to do some good. Steeling himself, Regdar stepped inside. "Take me to her," he ordered.

For just an instant, he felt a small hand take his own, and then pain flashed through his body, from his fingers to his heart. Even as he collapsed to his knees, chest too tight even to shout, he felt the "hand" pass straight through his flesh, and he heard the little girl sigh.

"Oh, drat. I can't reach you either."

Ghosts are perhaps the most paradoxical of the undead. Held to the Material Plane through raw emotion, ghosts possess a burning need to complete some task or remain near some person or place. While love and determination are often the driving motivations behind a ghost's existence, ghosts invariably turn into beings of hatred and stasis, destroying all who would interfere in their eternal existence even as they desperately seek a way out of it.

The majority of ghosts have some task of great importance left undone. Possibly as simple as exacting revenge on whoever killed them, or as complex as completing the translation of a dead language, ghosts can often be destroyed only by completing whatever task they left unfulfilled. Further, all ghosts believe they died violently or of unnatural causes. A woman who dies of old age probably doesn't become a ghost, unless she believes she was poisoned. Similarly, those who die of illness rarely rise as ghosts unless they believe the plague was deliberately spread. The truth of the matter is unimportant; only the individual's strongly held belief matters.

In a few rare instances, the ignorant or innocent might remain as ghosts without even realizing they are dead. These ghosts can be even harder to destroy, for they cannot rest until they understand and accept the fact that they have died. Source: *Monster Manual*, page 116.

Ghoul

It just hadn't occurred to him.

Lidda had been dragged into a hidden passage, but Redgar hadn't seen by what. He'd followed her in and found a band of foul undead already leaning over her, chewing on her, ripping her flesh. He'd torn into them with a shriek of rage, and the sheer impact of his attack had scattered them long enough for him to scoop up the halfling and carry her away. There he'd camped for days, waiting for her to snap out of the fever that wracked her body.

Regdar just assumed it was an infection brought on by the filthy nails and teeth of the creatures. It never occurred to him to think that, just maybe, the illness she'd contracted was anything more.

Now, as he lay paralyzed, the corpse of his best friend slowly eating his left leg, he had nothing left to do but think about what he'd done—and what he would soon become.

Ghouls most often result from an infection of ghoul fever or the create undead spell. In some instances, however, individuals who spent their lives feeding on others spontaneously rise as ghouls. This "feeding" can be literal, such as habitual cannibalism, or figurative, such as a tax-collector who takes more than the law requires so he might feed his avarices. Only those who commit these acts personally risk becoming a ghoul. A distant lord who commands his soldiers to rob the peasants blind is not at risk, but a greedy landlord who charges poor families every copper they own and then cheerfully evicts them certainly is. Some see the transformation into a ghoul as a curse from the deities, punishment

for a life of greed and sin. Source: *Monster Manual*, page 118.

HUECUVA

"Damn you, Heironeous!" Sir Abran Shar, paladin and lifelong servant of the god of valor, sailed at the heavens, his holy symbol falling from slack fingers to the dirt at his feet. The shambling undead closed in from all sides, undaunted by his failed attempt to drive them back.

They had failed utterly, as had his efforts to heal his beloved Tricia. She lay dead beside the corpse of Abran's brother Varin, together even in death. Abran could have forgiven Tricia for the affair, but his brother? A betrayer who shared his blood? Varin had earned Abran's sword in his back. Surely Heironeous could not hold that against him, not after a lifetime of service!

"Damn you, why have you forsaken me?" Abran felt the first of the zombies tear into his flesh, felt himself falling before the endless onslaught.

Legend tells that a huecuva results from a curse levied on fallen clerics, druids, monks, and paladins. As punishment for their heresies, their patron deities condemn them to a state of eternal undeath.

In truth, this is only partially correct. Most deities who count paladins and druids among their servants are unlikely to inflict such an undead horror upon the world. Indeed these fallen souls are cursed by their patron—but that curse is simply the complete abandonment of the former servant's soul, leaving him open to whatever evils might lurk in the depths of his spirit. Eventually, these evils consume him, leaving little but resentment and loathing for the

deity that once favored him. Only then, when such powerful hate mingles with lingering divine energy does the fallen faithful become a huecuva. Source: *Fiend Folio*, page 94.

LICH

The venerable mage screamed as the magic flowed through him, tearing him apart from within. His body quaked with the palsy that had threatened to rob him of his spells, yet his fist remained clenched around the tiny metal box that was his salvation—and his curse.

For just a moment, as he convulsed and the few remaining hairs fell from his head, his eyes widened in horror. A part of him suddenly realized what he was about to lose, and his soul quailed at the

thought. The dying part of him was the same part that cared. Before he could even draw breath to scream, it was gone, and he needed to draw no breath at all.

As the quintessential "self-made" undead, a lich is a spellcaster who becomes undead through a complex ritual that takes years of research and careful experimentation. This involves the creation of a phylactery, a vessel to contain the lich's essence. The process requires Craft Wondrous Item, 120,000 gp, and 4,800 XP. Discovering the proper formulas and incantations to create a phylactery requires a DC 35 Knowledge (arcane) or Knowledge (religion) check. This check requires 1d4 full months of research. Note that this check represents starting from scratch and can be bypassed entirely if the knowledge is available (such as through a tome or tutor).

Perhaps the most common form of the accompanying ritual for arcane liches—although not the only one—involves the spells *create undead*, *magic jar*, and *permanency*. The comparable rite for clerical liches involves *create undead*, *harm*, and *unhallow*. Some sages worry about the fact that

the rite to become a lich varies and exists in so many combinations. It almost seems as though some greater power wanted to make it relatively easy for those who wished to become liches to do so. Source: *Monster Manual*, page 166.

Mohrg

The cheering crowd all but drowned out the thump of the trap door beneath Cairan's feet and the snap of the noose around his neck. His tongue protruded from his lips like an eel, seeming to twitch of its own accord. Tordek watched impassively as the murderer's feet kicked twice, and then fell still. The dwarf moved to go, then glanced back. Surely it was a trick of the light, a shadow in the rising sun, but Cairan's tongue seemed almost to protrude further still from his slack mouth. Concerned, and unable to press through the throng, Tordek turned from the courtyard and raced to the nearest temple.

When he and the cleric returned, forcing their way through hordes of screaming people and confused guards, the courtyard was empty but for a dozen blood-stained corpses and an empty, swinging noose.

Mohrgs are mass murderers or similar villains, but not all dead murderers become mohrgs. To become a mohrg, a killer must not only fail to atone for his crimes, he must intend to kill again. In other words, only murderers whose sprees are interrupted by death rise as mohrgs. A hanged killer possesses a better chance of rising as a mohrg than one slain through any other means. Even the wisest sages maintain no real idea why this should be, although some speculate it is because hanging is often considered the most dishonorable means of execution.

Only the spell *create undead* can form a mohrg from a corpse that

is not a murderer. Source: *Monster Manual*, page 189.

Mummy

Nebin hastily translated the inscription on the dusty tomb walls. "They stand before him in his eternal house, behind him, and to either side. They are ever watchful, although they sleep, Anubis shows to them their foes."

"Wonderful!" shouted Tordek, while busily chopping away at the dry corpse bent on crushing his skull. "Read faster!"

Stuttering, Nebin continued, "They are loyal to Akht-Thukonin, Emissary of Twice-Living Osiris. And the gods will carry them on swift winds to strike down whomsoever shall desecrate his home."

"I thought you said there would be some way to stop them—" Tordek shouted just as one of their stone hard fists slammed into the side of his head.

Normally formed via ancient burial rites, the process to create a mummy

involves complex spells, chants, and designs. The mummification ritual entails the removal of internal organs and the slow drying and desiccation of the corpse. In many ancient cultures, mummification is reserved for royalty. In others, bodyguards and servants become mummified as well, in order to better serve in the next world. Most mummification rituals do not result in undead—merely desiccated corpses. Those that do produce undead creatures often intend to do so from the outset, using *create undead* to create guardians or undying minions.

On very rare occasions, an individual might spontaneously rise as a mummy. If a person dies in a state of anger and hatred and if his body is naturally mummified or preserved, due perhaps to exposure to great heat and dryness, the individual might reanimate and seek to destroy the object of his rage. These "natural" mummies lack the funerary wrappings of standard mummies, and can easily be mistaken for other forms of corporeal undead. Source: *Monster Manual*, page 190.

Nightshade

Mialee sank to her knees, exhausted, as she allowed the gate to close. Even over her panting breaths she could hear Jozan limp up behind her. "We did it, Mialee. A dozen years, but Regdar is avenged."

The elf looked up through strands of blood-matted hair. "It was a near thing. We couldn't have beaten that demon."

"We didn't have to." Jozan looked at the spot where the gate had stood. "Even fiends can have the life sucked out of them. That's a world of pure anti-life. Nothing can survive that."

The cleric was right, of course. Not even the great fiend could survive the Negative Energy Plane. As those energies invaded its body, turning it into something other than what it had been, it clung to its hate, determined that—living or dead—it would make those mortals pay for what they had done.

Nightshades were entities of pure evil even before they became

undead. They result when outsiders with the evil subtype are continually subjected to negative energies long after death. The type of nightshade the fiend becomes is determined by adding up its Hit Dice and its Charisma modifier. If the total is 10 or less, the creature cannot become a nightshade. From 11 to 18, the creature might rise as a nightwing; 19 to 26, as a nightwalker; and 27 or more, as a nightcrawler. Nightshades, although intelligent, remember only pieces of their existence before becoming undead and retain none of their special abilities. Source: *Monster Manual*, page 195.

Shadow

With a shout of fury, Krusk forced Sir Baras's blade aside and drove his axe into the blackguard's collarbone. Had the knight of Hextor been fully capable, Krusk could never have beaten him. After Naull had struck Baras with a deep violet ray, however, the barbarian had found himself the blackguard's equal. Baras's eyes went wide, and then clouded as the life drained from him.

"Told you not to interfere," Krusk grunted between gasps, spent by the fury of battle.

"You were losing," the wizard told him simply.

"Nah. Lulling him. False sense of security."

Still arguing, the pair moved from the torch-lit chamber. In the flickering firelight, Baras's shadow remained against the wall. It had not fallen when the knight collapsed, and now it moved silently, purposefully, after the worn adventurers.

In ancient times, before the development of *create greater undead*, the first shadow arose. Shadows spontaneously manifest when someone dies due, at least in part, to her own physical weakness. A warrior slain after rendered helpless by a ray of enfeeblement spell, an old woman murdered because she lacked the strength to fight back or scream for help, or a rogue slowly eaten by rats after incapacitation by poison might become a shadow. These creatures

lack the intelligence, purpose, and force of will possessed by ghosts. All a shadow understands its own weakness, and it must strengthen itself by stealing the vigor of others. Source: *Monster Manual*, page 221.

Spectre

"It is done!" Regdar raised the severed head of the assassin in one hand, his bastard sword clenched tightly in the other. Behind him, the other members of the duke's court clustered around him fearfully. Before him, floating in the entrance to the great hall, hung the spiritual image of the duke himself, slowly descending toward those huddled below.

"Your murderer has been discovered and slain!" the fighter continued, fighting the urge to flee from the hovering apparition. "Surely you need kill no one else

to slake your thirst for vengeance! You can move on to your well-earned rest!"

For long moments, the spirit hovered motionless. Then, with a bone chilling laugh, it drifted forward with its arms outstretched.

Spectres might almost be described as "proto-ghosts." When not created by spells or the touch of another spectre, they manifest in a similar fashion to ghosts. They rise from the violent death of someone who lacks the requisite strength of purpose to become a true ghost, yet who possesses sufficient will and fury that they cannot move on. They become an instrument of wrath and vengeance, lacking any goal or task whose completion might eventually allow them to find rest. Source: *Monster Manual*, page 232.

Sword Wraith

"The battle's over. The battle's over."

Mislee rocked back and forth, sitting on a fallen log, arms wrapped around her knees, whispering to herself. "The battle's over."

In all her years, fighting monsters and the armies of evil, she had seen nothing like it. Hordes of fiends, flights of dragons, and an endless sea of black-clad ones all lay in heaps around her. She overlooked a massive field carpeted in corpses and drenched in blood so deep that not a blade of grass could clearly be seen. She lived, only because Tordek—now laid out upon that field—did not. The spear had been meant for her, not for him.

Mislee screamed as pain lanced through her back and side. She turned as she tumbled from the log, and stared

up in horror at the blood-soaked beard and lifeless eyes of Tordek.

The battle is never over.

Like a ghost, a sword wraith is driven by a single-minded ambition that lingers after death—in this case, the desire to continue battle, to shed more blood. Unlike the ghost, however, the sword wraith's purpose might not actually be his own. The bloodlust and dark desires of his fellow soldiers often mixes with the sword wraith's own. Thus, the purpose that drives a sword wraith might belong to any one of the soldiers lying dead on the field, or might even be an entire platoon's combined discipline and love of carnage. This can sometimes create sword wraiths from the noblest commanders and the lowliest scouts. Source: *Fiend Folio*, page 173.

Vampire

"They buried him face down?" Lidda asked, her voice puzzled.

"That's right."

"Why?"

Joran shrugged at the halfling. "Because suicide is an affront to his god, and those who kill themselves might rise again, their desire for death met instead with eternal suffering. By burying him facedown, the locals hope that he will simply dig himself deeper when he attempts to claw his way out of his coffin, rather than escaping and feasting on them."

"Weird. So what's the problem?"

The cleric pointed to a burial plot in the center of the cemetery. The stone marker was askew, the earth piled in heaps.

"Clearly, it didn't work."

Almost everyone knows that vampires spawn other vampires, but myth and legend present many other possible origins for these infamous undead. In cultures that believe suicide is a sin, anyone who takes his own life might rise from his coffin as a vampire. Those who make deals with entities of evil and gods of death, seeking power or immortality, often become vampires, their desires granted in a most twisted fashion. Also, someone

who might otherwise spontaneously rise as a ghoul, slain specifically through negative energy or the result of a curse, might instead rise as a vampire, a drinker of blood rather than an eater of flesh. Source: *Monster Manual*, page 250.

Wight

It had been so long since Lady Anara could just relax.

For so many weeks she had dwelt in hiding, watching over her shoulder for the lover she'd scorned to marry Lord Hinnitz. It was only after she lost him that she learned what had happened to his last four paramours—for he had tried to do it to her as well.

The Watch had finally run him to ground and cut his throat on the spot. She no longer had to worry about footsteps in the middle of the night, or the feel of a cold chain around her neck. Lady Anara could finally relax.

"Hello, my love." The voice drifted to her from the doorway, a voice made hoarse by a severed windpipe. "I've missed you."

Wights, unless created by other wights, are animated almost entirely

by their desire to do violence. Just as ghouls arise from those who feed off others, wights result from the deaths of individuals whose sole purpose in life was to maim, torture, or kill. Simply coming from a profession that requires one to kill, such as a soldier or gladiator, is not sufficient; the individual must harbor a true love of carnage and take intense pleasure in ending life. Wights arise only when the person died frustrated, unable to complete a murder he had already begun, or unable to find a chosen victim. Source: *Monster Manual*, page 225.

Wraith

"Gimble, look at this." Hennet lifted the hand of the desiccated corpse, sending a puff of dust into the air.

The gnome bent, eyes narrowed. "Gods, Hennet. His fingertips are missing!" Indeed, even the bone was worn smooth, as though the man's fingers had been sanded down.

The sorcerer nodded, then pointed to the largest piece of stone that, until the

pair of explorers broke it in, had been a wall. Several shallow grooves marked the stone, the dried blood of centuries ago still faintly visible within.

"He was entombed alive in here," Hennet whispered. "Can you even imagine what that must have been like?"

Behind them, a dark form slid from the shadows, a dark form with the silhouette of the corpse they studied. Soon, it swore, they would not have to imagine.

Like spectres, wraiths are the spirits of those who died under horrific circumstances, but who lack the strength of purpose to return as ghosts. Whereas spectres are born from sudden acts of violence, wraiths result from slow, lingering deaths. Someone bricked up inside a wall and allowed to starve, or slowly poisoned, is more likely to return as a wraith than a spectre. Those wraiths who do not arise spontaneously result from the touch of other wraiths or from the create greater undead spell. Source: *Monster Manual*, page 257. ■

The Ecology of The Wemic

The best of both halves: the lion-men

by J. F. Keeping

Report from the High Scholar Thothus of the Temple of Thoth, to the King of Khemara, Ramnius:

It was six passings of the second moon ago that you, Sire, sent me on a mission to study the lion-folk who have long inhabited the savannahs on our southwestern border, to determine if they might make suitable allies in our ongoing conflict with the Kyrian barbarians. I am now ready to make my report.

Known variously as lion-men, lion-centaurs, and jungle centaurs (a misnomer, for they inhabit only grasslands), the lion-folk are called by scholars wemics, a rendition of their name for themselves. As we all know, wemics have the appearance of lions with human torsos, arms, and heads where the lions' heads should be, like to lions as centaurs are to horses.¹ Their lion parts are identical to those of true lions, covered in soft coat of golden-brown fur, with tails ending in tufts of dark-brown hair. The human portions are particularly muscular and hairy, and head hair is worn long in both sexes. Such hair is softer in texture than a male lion's mane. Males have thick, dark-brown manes that run down their backs; females have pale golden hair. Their faces are basically human, but with forward-thrust jaws, pointed ears (placed high on the head) that can move like those of a cat, and sharp feline teeth. Their eyes are feline as well, with pupils that contract to a slit in the day and open to great orbs at night, affording them excellent night vision.²

Their grooming is something over which the lion-folk are very careful. The males, in particular, seem almost foppish by our standards, though I have learned firsthand the dangers in showing amusement at this. They spend hours brushing and cleaning their fur (with crude brushes, not their tongues), and the males are almost obsessive in caring for their manes. Manes are combed, braided, dyed, and even decorated with jewelry on special occasions. The wives of married wemics help in mane-dressing, with the result that the

patriarch—the leader of a band of wemics, having several wives—has the best-kept mane in the group. To insult one's mane is considered cause for a duel among the lion-folk.

The lion-folk roam temperate and tropical grasslands in hunter-gatherer bands usually called prides. Each pride consists of about a dozen males, one or two dozen females, and as many as a dozen young, age five years or less.³ A number of loosely related prides in an area make a tribe (see below). Wemics are carnivores, but they cook meat and know how to preserve it with salt and various spices and herbs (they have acquired a taste for hot spices, in particular). They hunt often, for their active lives require them to eat twice as much as other humanoids of their size and weight.

Hunting reveals the personalities of the lion-folk. They constantly seek intense emotion and excitement, as found in love and battle. They express their emotions in roars and yowls of anger, sadness, or happiness. They fear nothing except boredom, and respect courage, loyalty, and honor above all else. They are always truthful, never hide their feelings, and always keep a vow until death. This remarkable honesty may be in part explained by their tails. Like domestic cats, wemics show their emotional states with their tails: held high for pride, hung low for fear, slashing for anger, tapping for annoyance, etc. Thus they see no use hiding their feelings when their tails betray them.

Tasks among the lion-folk are strictly segregated between the sexes. Males hunt while females guard the cubs; males make weapons and other metallic items while females make the tents and blankets; and so forth. Female wemics are more conservative and controlled than their male counterparts, more prone to contemplation than rash action. But they are no less fierce when their young are threatened, and they, too, believe in conspicuous displays of emotion. Although prides are led

by males, wives are a leader's most valued advisors (polygamy is practiced among the lion-folk but is permitted only to their leaders).

Courtship among the lion-folk is slightly different from our own. Although the male pursues the female, it is the female who makes the choice of her mate. The lion-men are forever grooming, strutting, and dueling to prove themselves the best consort. This is the reason why only wemic leaders have more than one wife: The lion-women are very practical and always choose the strongest and wisest mate, and who would be stronger or wiser than the pride's patriarch?

Like humans, wemics mate at any time of the year. The gestation period is six months. Twins and triplets are not common but are not as rare as with humanity. The cub is born with its eyes open, like a human baby, and grows at a remarkable rate. They are weaned at six months, then taught the skills of the pride by their third year. A father will teach his son, and a mother her daughter. Parents love their children immensely. By the time he reaches maturity, at age six or seven, a lion-man is 7' long with a 3' tail, standing at least 6' tall and weighing almost 600 lbs. Females are slightly smaller, being 6' long and 450 lbs., on the average. A wemic's life expectancy is 40-50 years spent in an intense, energetic lifestyle. Few males reach this age, however, for when a lion-man feels his strength and speed weakened by age, he grows increasingly reckless in combat, until he is killed. The females are more responsible but do not begrudge their husbands this final honor. Old males can be as warlike and foolhardy as young males, both groups eager to prove themselves.

The renown that the lion-folk enjoy as

Illustration by Stephen Schwartz

hunters is deserved. They are faultless trackers, using both their excellent noses and their knowledge of animal lore.⁴ They are as silent as any great cat and are able to conceal themselves from sight in their native grasslands. They have learned to use herbs to disguise their scent. They can run at up to four times their normal speed for bursts of two minutes or less, and are able to leap 10' up or 30' forward while standing, or 50' forward with a running start. They are clever hunters—hiding by a waterhole to leap upon approaching prey, or having one of their number circle around a herd to startle it into running upon the waiting spears of the other lion-men. Against larger opponents, they use ropes to entangle the legs, then leap upon the prey, hanging on with their claws and striking at the head with their spears. Even giant animals like the elephant will fall to the skill of these hunters. Although the pride I stayed with, the Long Claws, hunted zebras and antelopes (the wemics' major prey) and an occasional elephant, the patriarch, Wind-Chaser, spoke of tribes that hunted the great hornless rhino—the baluchitherium—and I had no reason to disbelieve him.⁵

Wemics consider hunting and battle to be almost the same thing. Against less intelligent foes, they use the same tactics as they use when hunting. Their other favorite tactics include pretending to

charge a battle line, then leaping over the line to land atop the unprepared troops behind it. Or they may pretend to retreat, letting the attackers run onto the spears of other wemics hidden in the brush. Often they will leap over fleeing foes to attack them by surprise from the front and cut off their escape. Their roaring is enough to unnerve most soldiers and rout all but the best-trained animals.⁶ (I was unable to question them further on their battle tactics, for obvious reasons.) But even without strategy, they are formidable in combat. Their human parts can withstand wounds that would kill most men instantly. They have the intelligence of men with the speed, strength, and agility of the great cats. If they could be persuaded to join our armies, we would have an unbeatable force.⁷

The lion-folk have a great respect for skill and strength in combat, but despite this, their feelings toward other races depend mainly upon whether or not those species are a threat to them. The stories of their hunting and eating humans are completely untrue; they do not eat sentient creatures and can find far easier prey than humans. The Lion Wars of 626-642 were caused by our settling of the southern plains, which they interpreted as a threat to their territory. Note that there have been very few incidents between our races since. They have little interest in

humans as a rule; indeed, they cannot usually tell humans and demi-humans apart, calling us all "the half-people." They respect the tabaxi and bear them no enmity, because the cat-men inhabit jungles and are therefore no threat to them. Warlike humanoids, particularly the tasloi, are hunted for sport; the lion-men consider them cowardly and very delicate (they die from wounds that would only annoy a wemic). Lions, oddly enough, are the lion-men's greatest enemies. Lions inhabit the same land and hunt the same animals, so they are the lion-folks competitors. For this reason, wemics attempt to drive off or kill any lions found in their territories.

As may be said of our own species, the lion-folks greatest enemies are themselves. Although prides within the same tribe do not fight among themselves, wemics of different tribes fight over land and prey constantly. This is considered quite normal by all, and the males enjoy the battle greatly. However, there is rarely lasting resentment between the tribes, and the females and young of a conquered tribe become full members of the conquering tribe without prejudice. Conquered males may join their conquerors' tribes, but must pass through torturous rituals and complete quests first. Otherwise, they are banished or slain.

As may be expected, the patriarch of a pride of wemics is the strongest male,

selected by ritual unarmed duels. However, when a number of related prides (usually from 3-30) band together to form a tribe, the leader of one pride is elected by the others to be the tribal leader, or chief. He retains the position of patriarch of his own pride as well. Rarely, a number of tribes (as few as two or as many as eight) will band together under a great hero who becomes their king, forming a clan or nation. The tribes, naturally warlike, are held together by the king's great charisma and reputation, and usually return to their former fragmented state after his death, unless the king's son is his equal in heroism and charisma.⁸ The wemics' greatest accomplishments and proudest history occurred under the banner of their few kings; surely Your Highness knows of the time that, under Twoclaw, the lion-folk conquered our unprepared ancestors in the years 489-555 and forced them to build their only city, which now lies ruined in the desert but is said to still contain the treasures taken from their human slaves.

Communication with the lion-men is hampered most by their peculiar language. Indeed, I was unable to talk with them at all without the aid of my spell of *tongues*. Their speech is composed of growls and screeches, impossible for us to understand, let alone imitate, though they are able to master the Common tongue

with little difficulty. The males have deep, growling voices, while those of the females are yowling and purring. Every human child knows of the lion-man's terrifying roar and hearty laugh, but few seem to know of their women's skill at singing. These songs are composed not of words, for a skilled lion-woman can make her voice sound like bells, a flute, a lyre, or all three at once. All lion-women are taught to sing at an early age. They create their own songs as well as learn the hundreds of songs the wemics have for everything from hunting to raising children to marriage. These songs are a very important part of religious festivals; consequently, all wemic witch doctors are female.

This brings us to the subject of religion. Wemics revere the Cat Lord, and several of their heroes (usually their ancient kings) have achieved semidivine status. They often swear by these—e.g., "By Swift-Tail's mane!", or ("By the claws of Redlegs!" However, they are not very reverent, and aside from annual festivals, they offer little homage to their god. Consequently, witch doctors often find themselves as doctors and diviners more often than priests. Their greatest witch doctors (by my estimate) have acquired powers not much less than those of His Reverence, Thurgood II, our High Priest, and they share a small degree of my own talents as a sorcerer.

As to their origins, the lion-folk that I

knew claim to be the descendants of a band of mighty human warriors who worshipped the Cat Lord. In reward for their valor, these warriors were given speed and strength equal to their courage, becoming half-man, half-lion. The lion-folk recognize their connection to both men and lions, but consider themselves a separate species, better than both. As to the truth of this—who can say?

Wemics lack a written language but are skilled artists, and they record their thoughts and deeds through paintings and carvings. Weapons are carved into the shape of slain enemies; shields are painted with scenes of great battles, and tents with family history. Each pride has several rolls of painted hide detailing its history and beliefs. These are carefully guarded. When a pride is conquered, these rolls are burned, symbolizing the death of the pride as an entity.

Wemics care little for magic. They are more interested in the skills of the warrior. Rarely, a patriarch may possess a magical weapon or shield, recognizing its useful qualities, but that is all. The lion-folk do appreciate the beauty of gems and jewelry, and they may keep coins they find as trade goods for humans. (Your Highness may wish to know that the wemics with whom I stayed claimed that they traded with some of our outlying villages even when we were at war with them.) Treasure found or plundered is considered the property of the finder.

The main vice of the lion-folk is their overindulgence in alcohols. *Mal*, a fermented melon, and *grum*, fermented coconut juice, are their favorites, but they also enjoy human liquors. At victory celebrations, the whole pride—males, females, and children—may drink themselves into a stupor. At these times they can be dangerous, attacking playfully and killing without meaning to do so. They have little foresight or wisdom in this regard, to my sorrow.

In conclusion, I can positively state that the lion-folk would make excellent allies. However, enlisting them as troops will be difficult. They are reluctant to leave their lands or join in a battle which does not concern them, despite their love of combat. Their respect must be earned, not bought, and there are very few humans who live up to their standards of military prowess. Wages would also be a problem. They could be paid in gems, jewelry, and other items of beauty, but the price would probably be too high to be practical. Great gifts of art and treasure might persuade them into signing a mutual defense treaty, but that is something for diplomats and not scholars. I suggest we keep relations with them peaceful and pursue trade with them, except in the matter of alcohol. And we should be neither too weak nor too strong in their presence, to strike the proper balance of respect and threat. My task is done.

Chapter Ten

WEREWOLF

"LOOK UP IN THE SKY AT THE MOON, FULL AND SWOLLEN LIKE A GRAVID BITCH. CAN YOU FEEL ITS PULL? CAN YOU FEEL THE BLOOD POUNDING IN YOUR VEINS, FULL OF LIFE, FULL OF POWER? IT WON'T BE LONG NOW. DON'T FIGHT IT. YOU CAN'T WIN. YOU ARE THE BEAST NOW. TAKE A DEEP BREATH. TASTE THE WIND. SMELL THAT? IT'S THE SCENT OF FRESH MEAT, THE SWEET REEK OF FEAR. FEAR OF YOU. THERE'S ONLY TWO KINDS OF CREATURE IN THIS WORLD FOR YOU NOW, BOY, PREDATOR AND PREY. YOU'RE THE PREDATOR, EVERYTHING ELSE IS PREY. SOON, YOU'LL FEEL THEIR HOT LIFEBLOOD GUSHING BETWEEN YOUR TEETH, THEIR FLESH RIPPING BENEATH YOUR CLAWS. GO, NOW. HUNT. REVEL IN THE SAVAGERY. SLAKE THE BLOOD-THIRST FOR TONIGHT. AND TOMORROW NIGHT, YOU'LL DO IT ALL OVER AGAIN."

—BROGAI NAVRATIL, ARTHFELL WEREWOLF, TO ONE OF HIS NEW "PUPS"

Men who can turn into beasts, werewolves prowl the dark fringes of civilization, culling the weak and unwary from the larger human herd. These ravenous creatures are victims of the curse of lycanthropy, consumed by a rage not unlike that of some barbarian warriors, but with a maleficent twist. The bestial desires of a rabid wolf course through their veins, driving them to acts of barbaric cruelty and animalistic fury. Most of these individuals embrace their savage hungers, becoming evil monsters that stalk the night. An unfortunate few vainly struggle to fight the curse, but these are inevitably consumed by the beast within, giving in to the thirst for blood and slaughter.

Werewolves come in two varieties, natural lycanthropes (those born with the condition) and afflicted lycanthropes (those who contract lycanthropy as a curse or disease from another werewolf). Natural werewolves have complete knowledge of their state and perfect control over their abilities. Afflicted werewolves, on the other hand, often change form involuntarily, an event usually triggered by the full moon. While in animal form, they frequently lose their identities and retain no memories of their actions.

All werewolves can change into three different shapes: a normal humanoid, a wolf form, and a terrifying hybrid humanoid-wolf shape. A werewolf in humanoid form blends easily into civilized society, and the simple peasants of frontier villages know that any stranger's face could hide the predator in their midst. In wolf or hybrid form, a werewolf becomes highly resistant to damage—only magic and weapons crafted of silver can harm them with any degree of success—but its humanoid shape possesses no such immunity. Regardless of its current shape, a werewolf reverts to its human form when slain.

In contrast to other lycanthropes, werewolves take a much more direct interest in their victims. A wereboar might keep to its forest, attacking trespassers out of aggression rather than maliciousness, or a wererat may lurk in the sewers, only occasionally murdering an innocent when the opportunity presents itself, but werewolves stalk their prey with the chilling patience of a careful, intelligent hunter. They delight in terrorizing their victims, prowling around their villages and homes, or even better, hounding them to the point of exhaustion, howling dreadfully to the moon to instill debilitating horror before closing in for the kill.

For all their prowess at hunting, however, werewolves are also savagery and violence personified. When their urges overtake them, the quiet hunter becomes a mindless beast, reveling in wanton destruction. Like a rabid wolf who preys upon a flock of sheep, slaughtering far more than it can eat for the sheer pleasure of it, a werewolf doesn't need an external reason for its rampage—the hunt is the reason, and anything unable to defend itself from the werewolf's depredations is prey. A rough woodsman, a simple peasant girl, or an innocent child are all fair game for the werewolf's bloody sport.

ECOLOGY

In their humanoid form, werewolves are indistinguishable from any other members of their race, although natural werewolves and those who have been afflicted for a long time may have or acquire wolfish features. According to folklore, natural werewolves tend to look somewhat feral, with a full head of shaggy hair and a wild look in their eyes. Other traits include eyebrows that meet together, index fingers longer than the middle fingers, curved fingernails, odd birthmarks on the palms, or a loping, lupine gait. Some superstitions even claim that a werewolf in its human form can be recognized by bristles of hair under its tongue, a vestigial tail, or cutting its skin to reveal fur in the wound.

In wolf form, a werewolf looks like a normal wolf, albeit a large and powerful specimen. A close look at the creature's eyes, however, may reveal its true nature, as they often glow red or yellow with an inner fire and display a spark of unnatural and cruel intelligence. In its hybrid shape, a werewolf resembles a human-sized wolf walking upright on two legs (but occasionally running on all fours). While a werewolf in hybrid form has the bite of a wolf and sharp claws, it is also able to wield weapons in its clawed hands.

Lycanthropy itself is an affliction somewhere between a curse and a disease. To a natural werewolf, of course, it is simply a trait inherited at birth, but to an afflicted werewolf, it's an unnatural malady. The curse of lycanthropy is transmitted through a werewolf's bite. Only a true, natural werewolf can pass along this curse; the bite of an afflicted werewolf is no worse than that of a normal wolf.

Once contracted, the disease shows no symptoms until the next full moon, when the beast within first overcomes the afflicted person and she changes into her animal form. The stress of combat can also trigger these changes. Most afflicted werewolves remember nothing of these episodes and wake up far from home the next morning, perhaps covered in the blood of those they slaughtered and with a profound feeling of melancholy or depression. Those few who do remember their actions and embrace their newfound power soon find themselves consumed by the evil and fury their new form incites. Once an afflicted werewolf truly accepts the curse, the beast has won.

Magic provides the best cure for lycanthropy. A *remove disease* or *heal* spell from a powerful cleric has the best chance of success, but such remedies must be sought within 3 days of infection. *Remove curse* and *break enchantment* magics can also be used, but they are only effective during the time of the full moon, when the werewolf is at its strongest. A dose of wolfsbane (*Pathfinder RPG Core Rulebook* 560), also known as monkshood, can also cure the affliction, giving the target another saving throw against the affliction. Fresh wolfsbane works best, but the plant is poisonous and has a chance of killing the recipient rather than curing him. Of course, natural werewolves cannot be cured of their condition.

SUPERSTITIONS AND SAFEGUARDS

Besides the standard cures, many folk remedies exist for curing lycanthropy, though most healers and priests discount such treatments as ignorant superstitions. One common belief is that exhaustion can cure a werewolf. Afflicted werewolves (or those thought to be infected) are often forced to toil at hard labor without rest, thus tiring the beast and purging it from the victim's body. Another commonly accepted remedy is immersing a werewolf in holy water during a new moon.

Other so-called "cures" include the presentation of holy symbols, particularly those of gods of animals or healing, such as Erastil and Sarenrae; driving nails (often silver ones) into the werewolf's hands or paws; striking the werewolf forcefully on the forehead with a dull knife; or even addressing a werewolf by its given name three times in succession.

A final remedy is skinning the werewolf in its hybrid or animal form, thereby separating the wolf from the man. One wonders, however, what sort of werewolf would be docile enough to allow such a procedure, or whether the unfortunate sufferer would survive the "treatment."

Many strange beliefs exist for safeguarding oneself from the predations of werewolves. Wolfsbane proves most successful, as it has a reputation for repelling werewolves as well as curing the affliction of lycanthropy itself. Holy symbols and holy water remain popular defenses, even though werewolves are not undead and have no known vulnerability to such instruments. Because silver is known to harm werewolves, some people favor wearing silver jewelry for protection from werewolf attacks. Wealthy villagers also spread powdered silver outside doors and windows to keep werewolves at bay. Rye, mistletoe, and the berries of the rowan tree or mountain ash are also believed to be effective. Whether these remedies and wards have any actual effect is up to the GM, though PCs should be able to research them and come to their own conclusions.

HABITAT & SOCIETY

While werewolves may live anywhere, from towns and cities to sparsely inhabited forests, natural and afflicted lycanthropes frequently lead very different lives. Afflicted werewolves, fighting a terrible disease that turns them into ravenous beasts, tend to be solitary individuals, living in self-imposed isolation either to avoid discovery or in an attempt to protect family and friends from their own bestial urges. Alone on the frontier, many turn to banditry to support themselves. Natural werewolves in human form live just as humans do, while those who prefer their beast shapes might live in a cozy wolf den, although the comforts of civilization, such as soft beds and warm fires, usually draw them back to human society.

A rare few afflicted werewolves manage to keep the beast at bay, retaining their own personalities and morals while struggling with the bestial urges that threaten to consume them 3 nights a month. Pariahs within werewolf society, these good-natured werewolves frequently lead lives just as secretive and hidden as their evil brethren, as few towns suffer the continued existence of a known werewolf in their midst. To their misfortune, most such werewolves find that people react with alarm and prejudice regardless of the werewolf's true intentions.

Natural werewolves have long since grown accustomed to the hatred and fear their presence engenders, and those who dwell in civilized lands often lead normal lives within human society, attempting to blend in as much as possible. Such quiet, peaceful existences are often short-lived, however, as the beast within cannot be denied for long, and these werewolves' idyllic lifestyles usually end in blood-drenched frenzies. In the hinterlands, natural werewolves habitually gather into packs, either of other werewolves in areas where lycanthropy is widespread, or as leaders of packs of normal wolves.

Whether in human, hybrid, or wolf form, natural werewolves can communicate with wolves and dire wolves, allowing them limited control over these beasts. Afflicted werewolves only have this ability in their hybrid and wolf shapes; in their human forms, they possess no special empathy with wolves. Stories persist of werewolves who can also talk to dogs and other canines, and legends speak of particularly powerful werewolves who are able to speak with more unusual lupines such as shadow mastiffs, winter wolves, and worgs.

Werewolves who have embraced their bestial nature sometimes worship the demon lord Jezelda, Mistress of the Hungry Moon. Especially prevalent among the werewolves of Andoran's Darkmoon Vale and Lozeri in northern Ustalav, Jezelda's faithful hate non-werewolf lycanthropes in particular, and go to great lengths to hunt and slay those heretical abominations. Less-devout werewolves may venerate other gods—Lamashtu, Rovagug, and even Urgathoa, in her aspect as goddess of gluttony.

Even rarer than afflicted werewolves who maintain their good alignment, a few legendary natural werewolves known as the Hounds of Good are said to exist. While not an organized order or society, these paragons of righteousness nevertheless dedicate themselves to the fight against evil. Most people dismiss them as myths, but ancient texts refer to the Hounds of Good as creations of the slain beast-god Curchanus, charged with hunting down and destroying demons, devils, and other creatures of evil.

CAMPAIGN ROLE

Although werewolves are ravening killers, their role as deceitful hunters can also be played up in a campaign. PCs tasked with investigating a series of unexplained murders might, after a string of red herrings, find a werewolf

responsible—either a natural werewolf in full control of itself and willingly indulging its thirst for blood and mayhem, or an unfortunate afflicted werewolf with no recollection of its gruesome activities.

Alternately, a werewolf could stalk the party through the wilderness, making hit-and-run attacks (maybe picking off a hireling or two) before fading back into the darkness beyond camp. Even worse, one of the PCs' hirelings or cohorts could be afflicted with lycanthropy and be behind the attacks. The killer must be stopped, but now the goal becomes curing the enemy instead of killing it.

Infecting a PC with lycanthropy is another way of introducing werewolves into a campaign, but care should be taken to keep the game focused. The werewolf template provides a character with a great number of abilities and immunities that can soon overshadow other players' characters, but the werewolf and his allies must deal with his indiscriminate fury and lack of control over his form. Even the most tolerant allies are likely to grow tired when the werewolf turns on them in the middle of battle or runs off in the night during an unexpected transformation.

In these situations, the focus should be on curing the character of lycanthropy. Perhaps wolfsbane doesn't grow in the region, and there are no high-level priests available to remove the affliction. The PCs need to search for an alternative cure, perhaps even hunting down the werewolf responsible for the affliction in the first place. In this case, the search for a cure becomes a very personal quest. Of course, dealing with the effects of alignment change as a result of lycanthropy can be an interesting roleplaying opportunity as well, especially if the afflicted character is a good cleric or paladin who must atone for the crimes they committed while not in control of their actions.

KNOWN WEREWOLVES

The following lycanthropes have a particularly bloody history or reputation.

Brogai Navratil: This blackhearted natural werewolf brigand ranges throughout Darkmoon Vale in central Andoran, occasionally retreating to the Wolfrun Hills for refuge during the vale's frequent purges of lycanthropes. A grizzled veteran of constant skirmishes with both the Fangwatch and the Diamond Regiment, Brogai once took a silver arrow in the eye, a wound that has never fully healed, leaving him with just one burning yellow eye in beastform.

Brogai delights in attacking isolated farms and logging camps, spreading his "gift" to unfortunate woodsmen and loggers, and forcibly inducting them into his pack of bandits when they change at the next full moon.

Wolf's Ear: The Varisian town of Wolf's Ear squats beneath the dark eaves of the Churlwood on the banks of Ember Lake.

Once a colony of relatively peaceful lycanthropes, Wolf's Ear was ravaged when Magnimar and the Church of Erastil "eradicated" lycanthropy in the town in a bloody pogrom. The fact that most were-creatures simply went underground is an open, though never spoken, secret. Werewolves make up the majority of lycanthropes in Wolf's Ear, and have become adept at keeping their true natures hidden from outsiders. Usually content to subtly undermine Magnimar's authority in the region, they could prove a serious threat if their territory or autonomy

were encroached upon, a fact not lost upon the lord-mayor of Magnimar. Recently, a rebellious pack of werewolves, led by a disgruntled young woman named Ruxandra Katranjiev, has begun calling for more open action against Magnimar as well as purges of non-werewolf lycanthropes from Wolf's Ear. While thus far only a fringe group, their influence on the future of the region remains an open question.

Ylva Skallagrim: A tall, red-haired Ulfen woman, Ylva is a natural werewolf said to take the shape of a mighty snow-colored wolf. A legend in the Lands of the Linnorm Kings, Ylva leads a dozen chosen berserker warriors she has afflicted with lycanthropy, called the *Ulfhednar*. Ylva and her band sail a longship decorated with a snarling wolf figurehead instead of the traditional dragon's head, raiding and plundering coastal villages from Kalsgard to Magnimar, along with their pack of winter wolf allies. Feared up and down the coast of the Steaming Sea, Ylva, according to some reports, has her eye on becoming a Linnorm King herself, and perhaps intends to claim the empty throne of Trollheim.

OTHER LYCANTHROPES

Werewolves are not the only kind of lycanthrope, of course. Although similar in many ways (the ability to change forms, harmed by silver, etc.), these other lycanthropes have their own clearly defined roles, habitats, and societies.

Far to the north, great werebears prowl the cold forests and tundra, hunting and killing evil creatures wherever they find them. Though often irascible, most werebears are honorable and virtuous, and can make powerful allies for those able to get past their gruff exteriors.

FACETS OF FEAR

Human beings are fond of taming nature, of leaving their mark on the wilderness in the form of farms cleared from primeval forest or towns and cities erected where once only animals used to live. But for all the trappings of civilization, the night still waits with hungry eyes and wicked claws. Werewolves personify the fear of the beasts that howl in the long, dark winter nights, and prowl hungrily outside doors and windows that are locked and barred against the savage wilderness.

From the harsh, frozen north to the gentle climes of the south, wolf attacks on livestock are a widespread fact of life in a fantasy world (though the number of non-rabid wolf attacks on humans is historically negligible). To the simple peasant or herdsman, wolves are a plague upon humanity, killing livestock and (reputedly) lone travelers gluttonously and without remorse. What could be worse, then, than a wolf who can take human shape?

In addition, people naturally fear those who are different in some way. An unfortunate person who has trouble controlling his emotions might be suffering from psychological problems, but to an uneducated villager, an easier explanation is that he is possessed—perhaps a wolf in human form. A cold, calculating, but all too human serial killer is hard to imagine, but fear and superstition can easily create a monster that stalks the night. Livestock die and people go missing, and everyone wants a scapegoat to hold responsible. Where a simple animal or human explanation no longer suffices, people turn to the supernatural, and werewolves are there to take the blame.

Wereboars are as ill-tempered as the wild swine whose shape they take. Preferring peace and solitude, wereboars are not normally evil, desiring only to be left alone, but ferociously charge and attack anyone disturbing them or invading their territory. Some clans of hill giants are known to suffer from the curse of lycanthropy, changing into gigantic, though dim-witted, dire boars.

The most urban of all lycanthropes, wererats frequently make their living on the fringes of civilization, skulking and scavenging in the sewers and slums of cities. Wererats are opportunistic assassins, and while they have no qualms about killing, they are a cowardly lot and attack only if they can do so with no danger to themselves, or if the odds are overwhelmingly in their favor.

These are simply the most common varieties of lycanthrope. Sleek and powerfully built weretigers stalk the jungles and tropical forests of the eastern lands of Vudra and Tian Xia, while wereleopards hunt the veldt of Katapesh and Nex. From Osirion and Thuvia come tales of werehyenas, werejackals, and even wererocodiles. Less credible rumors speak of goodly wereravens, dwarven and gnome werebadgers, and

alluring elven werefoxes, though the veracity of such claims is suspect at best.

SAMPLE WEREWOLF

A resident of Wolf's Ear, Ruxandra Katranjiev was afflicted with lycanthropy at an early age. Always a rebellious sort, she chafed under the restrictions imposed upon the town's lycanthropes by its elders following Magnimar's "cleansing" of Wolf's Ear. A few months ago, Ruxandra claimed to have received visions from Jezelda, Mistress of the Hungry Moon, instructing her to drive out all non-werewolf lycanthropes from Wolf's Ear and throw off the yoke of Magnimarian imperialism. Banished by the town's more moderate leaders, Ruxandra now lairs in the tangled depths of the Churlwood, and has attracted a small but fanatical gang of followers who support her goals.

The pack commits heinous crimes that they can pin on non-werewolves, and use intimidation and fear tactics to cow the more peaceful residents of the town. Currently, Ruxandra is trying to collect enough silver weapons to arm her followers so they can purge Wolf's Ear of all non-wolf lycanthropes in an orgy of blood and carnage, leaving nothing but her own kind.

Ruxandra is a dusky Varisian woman, with dark hair and eyes, and intricate tattoos of glowering eyes, bloody teeth and claws, and wolf motifs covering her arms. She favors elaborately embroidered hunting outfits in red and blue, and wears many bangles and other jewelry. Always accompanied by her black wolf Fane, Ruxandra believes she has been chosen by Jezelda to do the demon lord's work on Golarion, and tolerates no challenges to her leadership or her visions.

RUXANDRA KATRANJIEV (HUMAN FORM)

CR 5

XP 1,600

Female human cleric of Jezelda 1/ranger 4

CE Medium humanoid (human, shapechanger)

Init +7; **Senses** low-light vision, scent; Perception +9

Aura chaotic, evil

DEFENSE

AC 19, touch 14, flat-footed 16 (+5 armor, +1 deflection, +3 Dex)

hp 36 (1d8+4d10+10)

Fort +8, **Ref** +7, **Will** +4

OFFENSE

Speed 30 ft.

Melee +1 alchemical silver scimitar +5 (1d6+2/18–20), mwk

alchemical silver kukri +5 (1d4+1/18–20)

Ranged mwk composite shortbow +8 (1d6+2/x3)

Special Attacks channel negative energy (1d6, DC 10, 3/day), favored enemy (humanoid [human] +2), favored terrain (forest +2)

Ranger Spells Prepared (CL 1st)

1st—*magic fang*

Cleric Spells Prepared (CL 1st)

1st—*cause fear* (DC 12), *disguise self*^P, *divine favor*

o (at will)—*bleed* (DC 11), *guidance*, *resistance*

D Domain spell; **Domains** Animal, Trickery

TACTICS

Before Combat Ruxandra casts *divine favor* and *magic fang* upon herself before combat.

During Combat A coward at heart, Ruxandra prefers to ambush foes and attack from a safe distance. If wounded, she flies into a rage and shifts into her hybrid form to attack in melee, focusing her attacks on any non-werewolf lycanthropes present. She normally casts spells only in her human form.

Morale If reduced to less than 10 hit points, Ruxandra flees.
